

2IMM15 Web Information Retrieval & Data Mining Email Filtering and Quering

GROUP 35

Chun Li
Alex Anthis
Kostantinos Messanakis

Project Overview: Using Information Retrieval and Machine Learning techniques to categorize the spam and non-spam emails, query through email dataset, obtain a cluster analysis of the dataset

Data Source: The dataset is formed by AUEB professor I. Androutsopoulos and contains a body of email messages in preprocessed txt format.

Workflow

Information Retrieval Part

1) Boolean IR

Goal

- Query data
- Indexing

Method

- Store in SQLite

	word	mail	frequency
	Filter	Filter	Filter
1	keplerstrasse	9-314msg1.txt	0
2	schrodt	9-314msg1.txt	0
3	pittner	9-314msg1.txt	0
4	beninca	9-314msg1.txt	0
5	padua	9-314msg1.txt	0

2) Word2vec

Goal

- Produce word embeddings

Method

- Skip-Gram model

Stop Words & Lemmatization

Goal

- clean data

Method

- NLTK

Source Data (2700 mails)

Stop Words & Lemmatization

Boolean IR

Naive Bayes

TF.IDF
Vectorization

Clustering

Word2vec

RNN

Logistic
Regression

Java Application

Machine Learning Part

1) Naïve Bayes

Goal

- Classify Email spam or ham
- Word frequency

Method

- Term frequency analysis

2) Clustering

Goal

- Group into clusters
- Specify characteristics

Methods

- TF.IDF Vectorization
- K-Means algorithm
