In our dataset we have included license plates of car's from different countries. The number plate should be dominant in the image. They also differ in the number of digits, color of the license plate, size of the image.

We have taken a few pictures as our primary dataset. The pictures were taken from the internet. As a license plate can be both on the front part or rear part of the car, so we attempt to test both. The first two pictures are the front view of the car and the second two pictures are the rear view of the car. We take both types of pictures to see if our algorithm works correctly for both of them or not.

Front view

Figure 1: resolution (870 * 580)

Figure 2: resolution(602*333)

Rear view

Figure 3: resolution (1280*960)

Figure 4: resolution(236*177)
