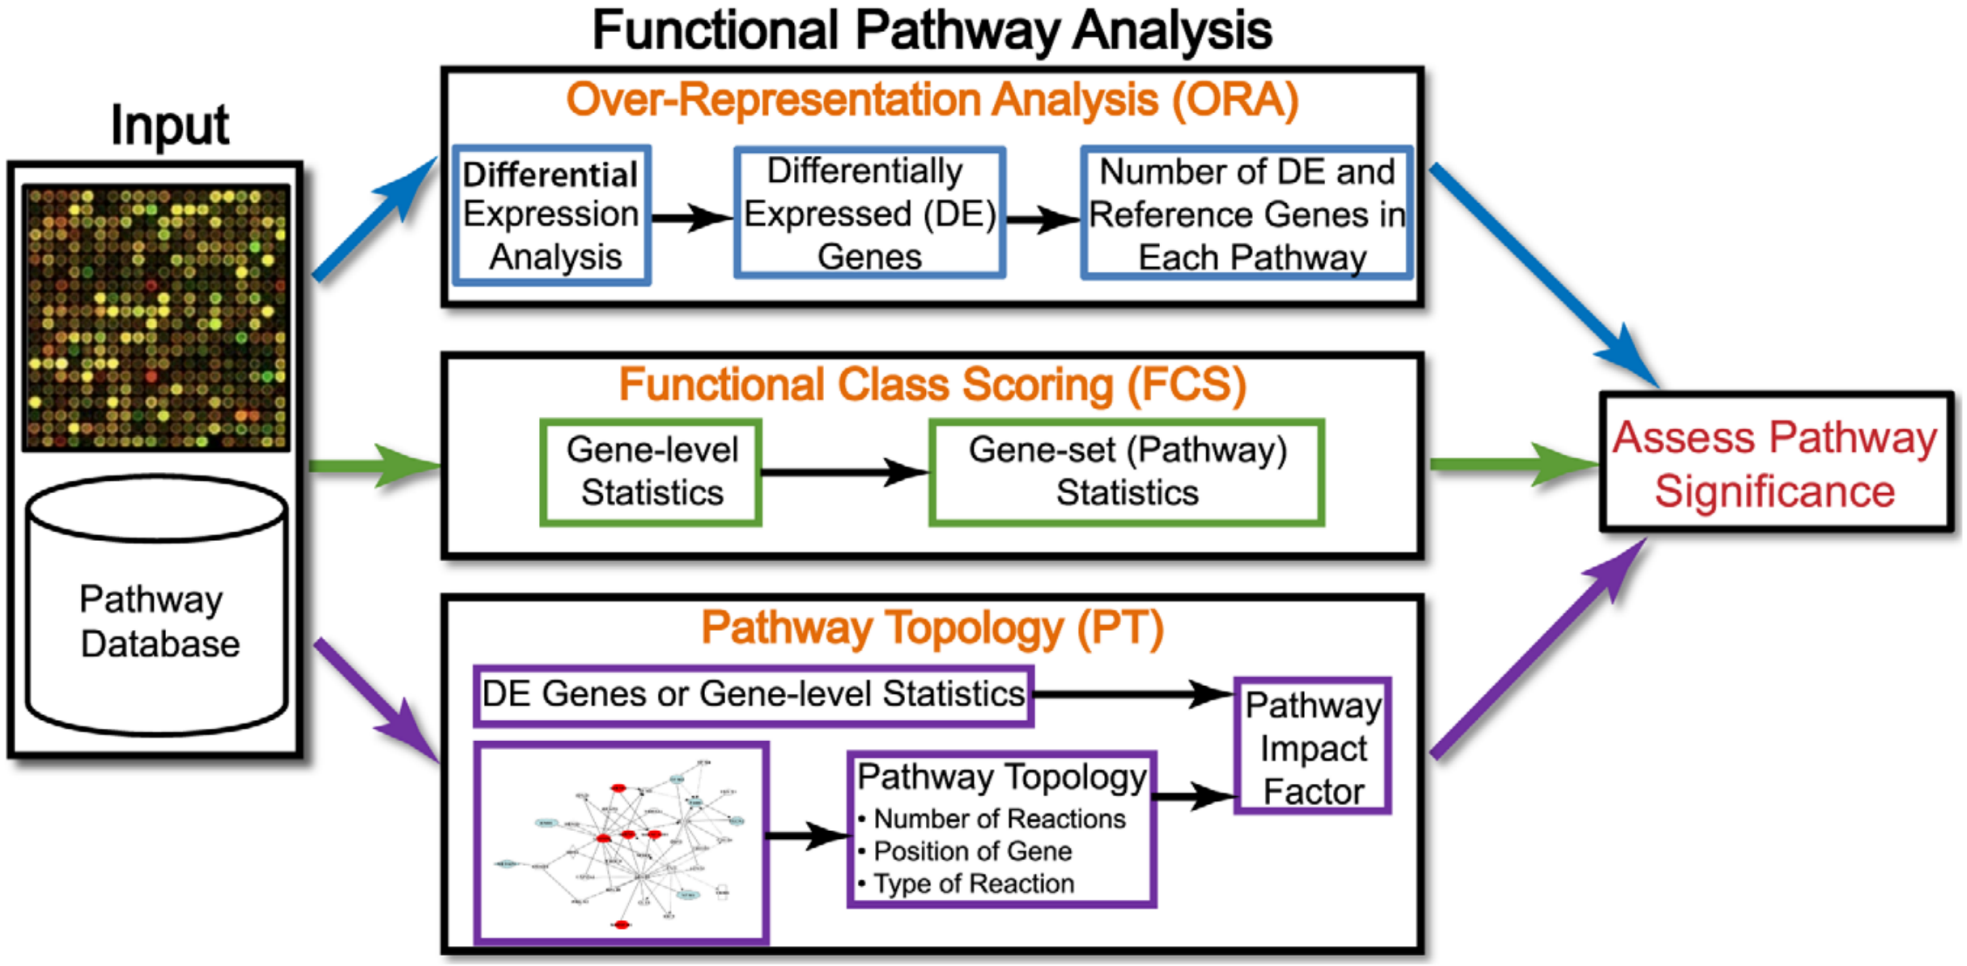
Enrichment Analysis Utilizing Active Subnetworks

Background

- One of the most common use cases of NGS technologies is to perform experiments comparing two groups of samples (typically disease versus control) to identify **a list of significant (altered) genes**
- This list alone often falls short of providing mechanistic insights into the underlying biology of the disease being studied

- To **reduce the complexity of analysis** while **simultaneously providing great explanatory power**, one can investigate groups of genes that function in the same pathways/gene sets: **enrichment analysis**

Background



Khatri P, Sirota M, Butte AJ. Ten years of pathway analysis: current approaches and outstanding challenges. PLoS Comput Biol. 2012;8(2):e1002375.

Motivation

- Utilizing protein-protein interaction information **enhances** enrichment results
  - Previous successful applications include GNEA, EnrichNet, NetPEA, PANOGA*

Liu M, Liberzon A, Kong SW, et al. Network-based analysis of affected biological processes in type 2 diabetes models. PLoS Genet. 2007;3(6):e96.

Glaab E, Baudot A, Krasnogor N, Schneider R, Valencia A. EnrichNet: network-based gene set enrichment analysis. Bioinformatics. 2012;28(18):i451-i457.

Liu L, Wei J, Ruan J. Pathway Enrichment Analysis with Networks. Genes (Basel). 2017;8(10)

Bakir-gungor B, Egemen E, Sezerman OU. PANOGA: a web server for identification of SNP-targeted pathways from genome-wide association study data. Bioinformatics. 2014;30(9):1287-9.

- With pathfindR, our aim was likewise to **exploit interaction information** to extract the most relevant gene sets (of pathways/gene ontology terms/transcription factor target genes, miRNA target genes etc.)

** pathfindR was developed based on PANOGA: a previous approach developed by our group for genome-wide association studies*

METHODS ARTICLE

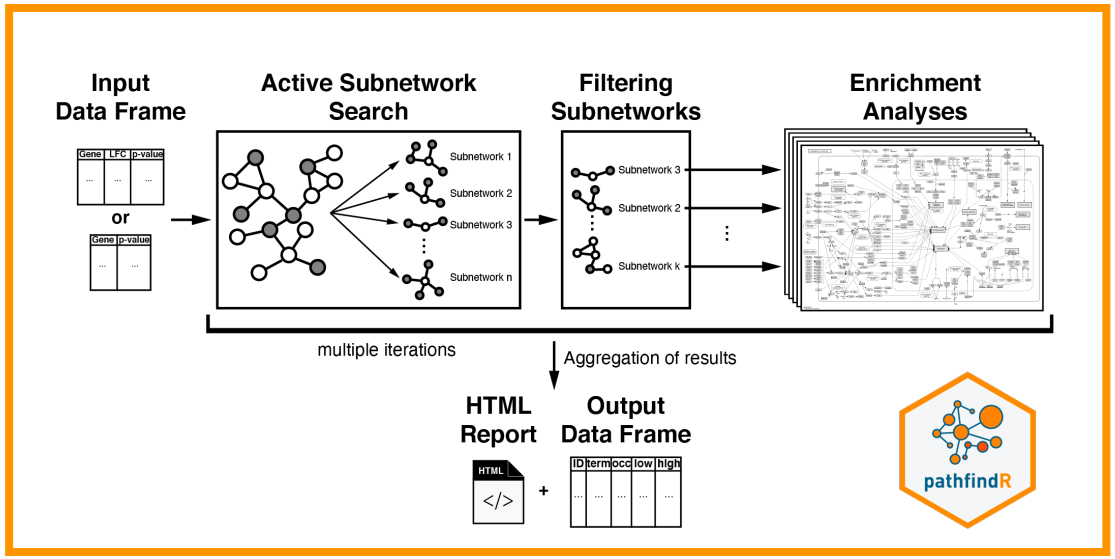
Front. Genet., 25 September 2019 | https://doi.org/10.3389/fgene.2019.00858

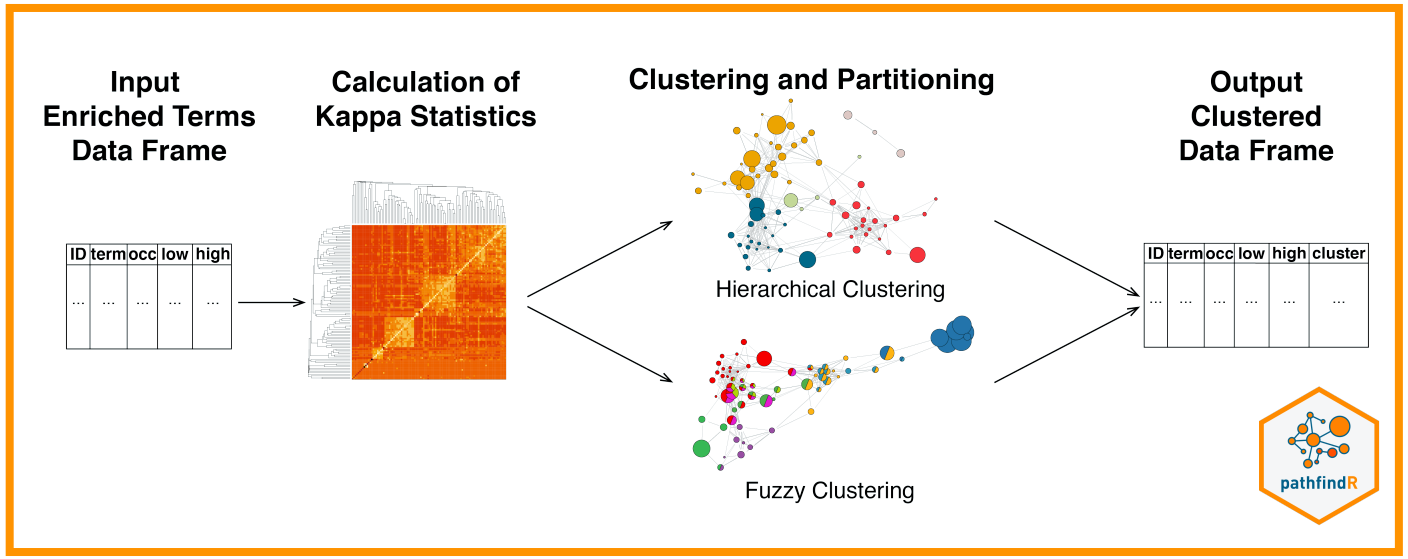
pathfindR: An R Package for Comprehensive Identification of Enriched Pathways in Omics Data Through Active Subnetworks

 Ege Ulgen[1*], Ozan Ozisik[2] and Osman Ugur Sezerman[1]

[1]Department of Biostatistics and Medical Informatics, School of Medicine, Acibadem Mehmet Ali Aydinlar University, Istanbul, Turkey

[2]Department of Computer Engineering, Electrical & Electronics Faculty, Yildiz Technical University, Istanbul, Turkey





- Using input genes, pathfindR identifies sets of genes that form **active subnetworks** within a protein-protein interaction network

  An active subnetwork can be defined as a group of interconnected genes in a PIN that predominantly consists of significantly altered genes.

- It then performs **enrichment analyses** on the identified active subnetworks (see above diagram)
- Additionally, pathfindR provides functionality to:
  - **Cluster enriched terms** (see above diagram)
  - Calculate **agglomerated score per term activity per subject**
  - Combine and **compare** 2 pathfindR enrichment results
  - Create various **visualizations** of the analysis

Active Subnetwork-oriented Enrichment Workflow

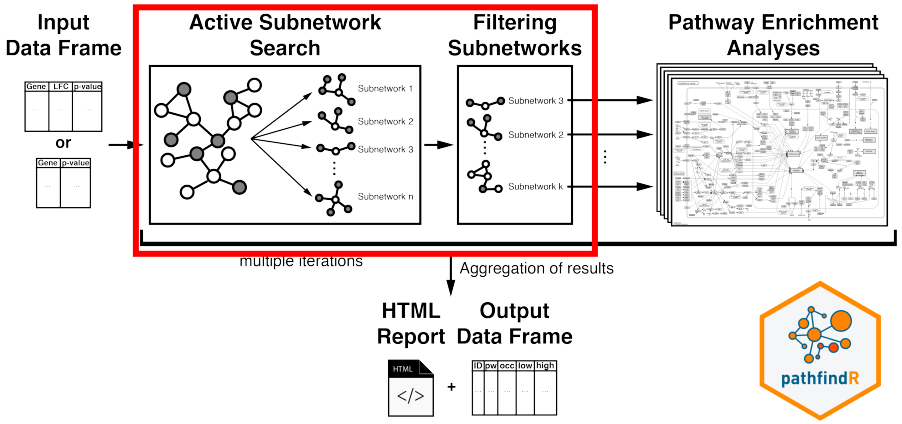
⋮



Active Subnetwork Search

- Active Subnetwork Search Algorithms:
  - Greedy Algorithm*
  - Simulated Annealing
  - Genetic Algorithm

- Available Protein Interaction Networks (PINs):
  - Biogrid*
  - STRING
  - GeneMania
  - IntAct
  - KEGG PIN
  - mmu_STRING (M.musculus)
  - **Custom PIN** (`path/to/PIN`)

- *The user may also use* **`get_pin_file()`** *for obtaining organism-specific PIN data*

**default options for pathfindR*

Scoring of Subnetworks

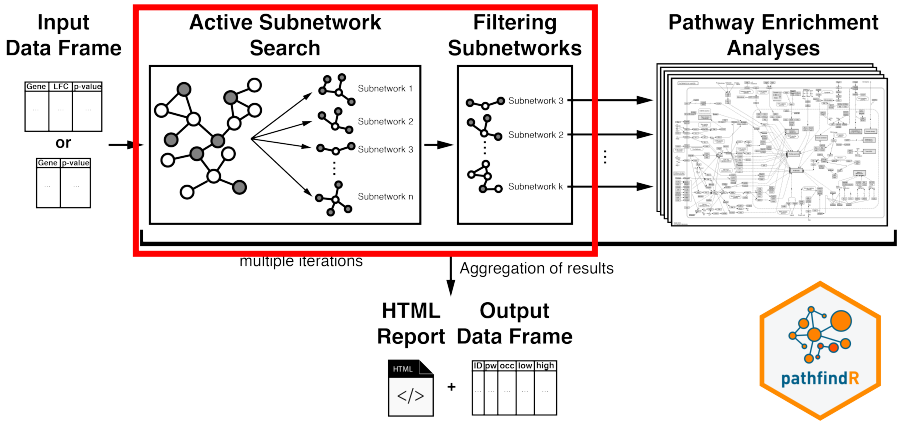
In pathfindR, we followed the scoring scheme that was proposed by Ideker et al., 2002). The p value of each gene is converted to a z score using equation (1), and the score of a subnetwork is calculated using equation (2). In equation (1) Φ^{-1} is the inverse normal cumulative distribution function. In equation (2), A is the set of genes in the subnetwork and k is its cardinality.

$$z_i = \Phi^{-1}(1 - p_i) \quad (1)$$

$$z_A = \frac{1}{\sqrt{k}} \sum_{i \ A} z_i \quad (2)$$

In the same scoring scheme, a Monte Carlo approach is used for the calibration of the scores of subnetworks against a background distribution. Using randomly selected genes, 2,000 subnetworks of each possible size are constructed, and for each possible size, the mean and standard deviation of the score is calculated. These values are used to calibrate the subnetwork score using equation (3).

$$s_A = \frac{(z_A - \mu_k)}{\sigma_k} \quad (3)$$



Active Subnetwork Search

Subnetwork filtering

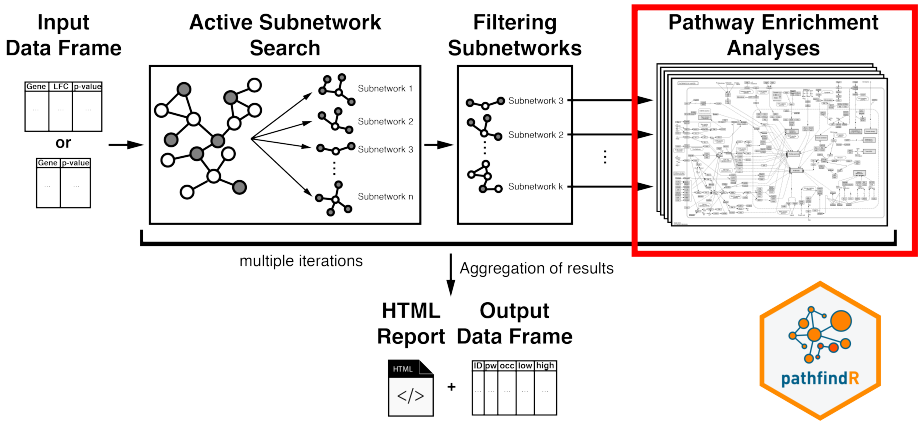
An active subnetwork passes the filter if it:

1. has a score larger than the given quantile threshold (default is 0.80) **and**
2. contains at least a specified proportion of input genes (default is 0.02).

Choice of Active Subnetwork Search Method

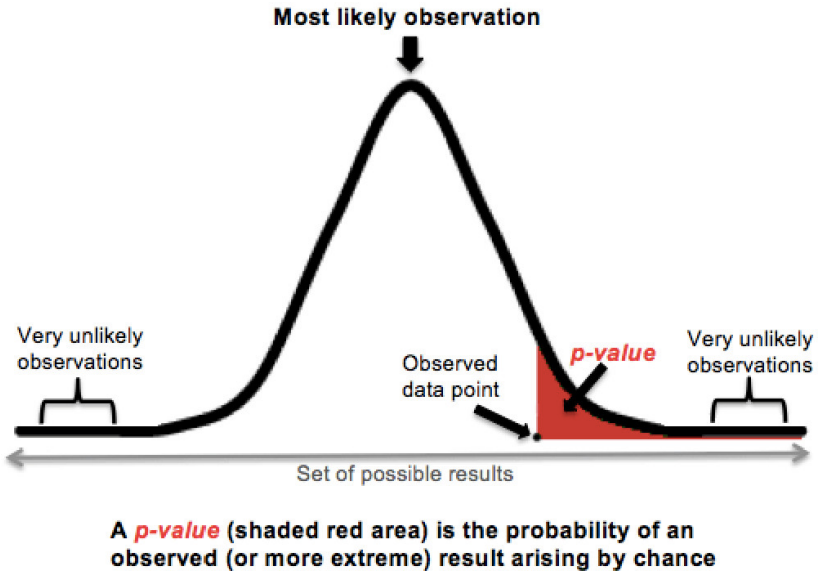
- In pathfindR, we use multiple subnetworks obtained via the chosen active subnetwork search algorithm
- We then filter the subnetworks and perform enrichment on the genes of each of these subnetworks separately and the enrichment results are aggregated later
- For this approach, the **default greedy algorithm** is sufficient and fast

- If the user decides to use the single highest scoring active subnetwork for the enrichment process, they are encouraged to consider greedy algorithm with greater depth, simulated annealing or genetic algorithm



One-sided Hypergeometric Testing

$$P(X = k) = \frac{\binom{K}{k}\binom{N-K}{n-k}}{\binom{N}{n}}$$



A *p-value* (shaded red area) is the probability of an observed (or more extreme) result arising by chance

- Available gene sets/pathways:
  - KEGG*
  - Reactome
  - BioCarta
  - Gene Ontology gene sets
    - GO – All (i.e., GO-BP + GO-CC + GO-MF)
    - GO – BP
    - GO – CC
    - GO – MF
  - mmu_KEGG (M.musculus KEGG)
  - **Custom gene sets/pathways**
- *The user may also use `get_gene_sets_list()` for obtaining organism-specific gene sets list from KEGG, Reactome and MSigDB*

**default gene sets for pathfindR*

pathfindR - Results

01 November, 2019

pathfindR-Enrichment results are presented below:

All terms found to be enriched

A table that lists all terms found to be enriched as well as lists of up- or down-regulated genes for each term. If it was requested, the term descriptions are linked to the visualizations of these terms, where affected color genes are colored by change values (if provided).

Tables of genes with converted gene symbols and genes without interactions

- A table listing the genes whose symbols (Old Symbol) were converted to aliases (Converted Symbol) that were in the protein-protein interaction network.
- A table listing the input genes for which no interactions in the PIN were found (after the aliases were also checked).

Agglomerated Scoring of Terms per Subject

Conceptual Background

For an experiment matrix (containing expression, methylation, etc. values), the rows of which are genes and the columns of which are samples, we denote:

- E as a matrix of size $m \times n$
- G as the set of all genes in the experiment $G = E_{i\cdot}, \ \ i \in [1, m]$
- S as the set of all samples in the experiment $S = E_{j\cdot}, \ \ \in [1, n]$

We next define the gene score matrix GS (the standardized experiment matrix, also of size $m \times n$) as:

$GS_{gs} = \frac{E_{gs} - \bar{e_g}}{s_g}$

where $g \in G$, $s \in S$, $\bar{e_g}$ is the mean of all values for gene g and $\bar{s_g}$ is the standard deviation of all values for gene g.

We next denote T to be a set of terms (where each $t \in T$ is a set of term-related genes, i.e., $t = \{g_x, ..., g_y\} \subset G$) and finally define the agglomerated term scores matrix TS (where rows correspond to genes and columns corresponds to samples s.t. the matrix has size $|T| \times n$) as:

$TS_{ts} = \frac{1}{|t|} \sum_{g \in t} GS_{gs}$, where $t \in T$ and $s \in S$.

CRAN release 1.5.1

pathfindR: Enrichment Analysis Utilizing Active Subnetworks

Enrichment analysis enables researchers to uncover mechanisms underlying a phenotype. However, conventional methods for enrichment analysis do not take into account protein-protein interaction information, resulting in incomplete conclusions. pathfindR is a tool for enrichment analysis utilizing active subnetworks. The main function identifies active subnetworks in a protein-protein interaction network using a user-provided list of genes and associated p values. It then performs enrichment analyses on the identified subnetworks, identifying enriched terms (i.e. pathways or, more broadly, gene sets) that possibly underlie the phenotype of interest. pathfindR also offers functionalities to cluster the enriched terms and identify representative terms in each cluster, to score the enriched terms per sample and to visualize analysis results. The enrichment, clustering and other methods implemented in pathfindR are described in detail in Ulgen E, Ozisik O, Sezerman OU. 2019. pathfindR: An R Package for Comprehensive Identification of Enriched Pathways in Omics Data Through Active Subnetworks. Front. Genet. <doi:10.3389/fgene.2019.00858>.
