## Quantum++

Version 1.0-rc2 - Release Candidate 2, 6 September 2017

**Build status:** Master Devel

Quantum++ is a modern C++11 general purpose quantum computing library, composed solely of template header files. Quantum++ is written in standard C++11 and has very low external dependencies, using only the [Eigen 3](#) linear algebra header-only template library and, if available, the [OpenMP](#) multi-processing library.

Quantum++ is not restricted to qubit systems or specific quantum information processing tasks, being capable of simulating arbitrary quantum processes. The main design factors taken in consideration were the ease of use, high portability, and high performance. The library's simulation capabilities are only restricted by the amount of available physical memory. On a typical machine (Intel i5 8Gb RAM) Quantum++ can successfully simulate the evolution of 25 qubits in a pure state or of 12 qubits in a mixed state reasonably fast.

To report any bugs or ask for additional features/enhancements, please [submit an issue](#) with an appropriate label.

If you are interesting in contributing to this project, feel free to contact me. Alternatively, create a custom branch, add your contribution, then finally create a pull request. If I accept the pull request, I will merge your custom branch with the latest development branch. The latter will eventually be merged into a future release version. To contribute, you need to have a solid knowledge of C++ (preferably C++11), including templates and the standard library, a basic knowledge of quantum computing and linear algebra, and working experience with [Eigen 3](#).

For additional [Eigen 3](#) documentation see <http://eigen.tuxfamily.org/dox/>. For a simple [Eigen 3](#) quick ASCII reference see <http://eigen.tuxfamily.org/dox/AsciiQuickReference.txt>.

## Building instructions for POSIX-compliant platforms

### Configuration

- Compiler: `g++` version 4.8.2 or later (for good C++11 support)
- `Eigen 3` linear algebra library. I assume here that the library is installed in `$HOME/eigen`, although the location may vary, e.g. if the library was installed using a package manager.
- Quantum++ library located in `$HOME/qpp`

### Optional

- `CMake` version 3.0 or later, highly recommended
- `MATLAB` compiler include header files: `/Applications/MATLAB_R2016a.app/extern/include`
- `MATLAB` compiler shared library files: `/Applications/MATLAB_R2016a.app/bin/maci64`

### Building using `CMake` (version 3.0 or later)

The current version of the repository has a `./CMakeLists.txt` configuration file for building examples using `CMake`. To build an example using `CMake`, I recommend an out-of-source build, i.e., from the root of the project (where `./include` is located), type

```
mkdir ./build
cd ./build
cmake ..
make
```

The commands above build the release version (default) executable `qpp`, from the source file `./examples/minimal.cpp`, without `MATLAB` support (default), inside the directory `./build`.

If the location of `Eigen 3` is not detected automatically by the `CMake` build script, then the build script will fail (with an error message). In this case the location of `Eigen 3` needs to be specified manually in the `CMake` build command line by passing the `-DEIGEN3_INCLUDE_DIR=path_to_eigen3` flag, e.g.

```
cmake .. -DEIGEN3_INCLUDE_DIR=/usr/local/eigen3
```

To build a different configuration, e.g. the debug version with `MATLAB` support, type from the root of the project

```
cd ./build
rm -rf *
cmake -DCMAKE_BUILD_TYPE=Debug -DWITH_MATLAB=ON ..
make
```

Or, to disable `OpenMP` support (enabled by default), type

```
cd ./build
rm -rf *
cmake -DWITH_OPENMP=OFF ..
make
```

To change the name of the example file or the location of `MATLAB` installation, edit the `./CMakeLists.txt` file. Inspect also `./CMakeLists.txt` for additional fine-tuning options. Do not forget to clean the `./build` directory before a fresh build!

---

## Building without an automatic build system

- Example file: `$HOME/qpp/examples/minimal.cpp`
- Output executable: `$HOME/qpp/examples/minimal`
- You must run the commands below from inside the directory `$HOME/qpp/examples`

### Release version (without MATLAB support)

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
-O3 -DNDEBUG -DEIGEN_NO_DEBUG \
-isystem $HOME/eigen -I $HOME/qpp/include \
minimal.cpp -o minimal
```

### Debug version (without MATLAB support)

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
-g3 -DDEBUG \
-isystem $HOME/eigen -I $HOME/qpp/include \
minimal.cpp -o minimal
```

### Release version (with MATLAB support)

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
-O3 -DNDEBUG -DEIGEN_NO_DEBUG \
-isystem $HOME/eigen -I $HOME/qpp/include \
-I/Applications/MATLAB_R2016a.app/extern/include \
-L/Applications/MATLAB_R2016a.app/bin/maci64 \
-lmx -lmat minimal.cpp -o minimal
```

### Debug version (with MATLAB support)

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
-g3 -DDEBUG \
-isystem $HOME/eigen -I $HOME/qpp/include \
-I /Applications/MATLAB_R2016a.app/extern/include \
-L /Applications/MATLAB_R2016a.app/bin/maci64 \
-lmx -lmat minimal.cpp -o minimal
```

## Additional building instructions for particular platforms

### Windows via Cygwin

- Some earlier versions of [Cygwin](#) had a bug related to lack of support for some C++11 math functions, see <http://stackoverflow.com/questions/28997206/cygwin-support-for-c11-in-g4-9-2> for more details. Quick fix: patch the standard library header file `<cmath>` using the provided patch `./cmath_cygwin.patch`. Latest [Cygwin](#) (as of Nov. 11, 2016) seem to have fixed the issue.

## Windows via Visual Studio

- `Visual Studio` versions preceding version 2015 do not have full C++11 support. If you decide to use `Visual Studio` make sure you install version 2015 or later.
- `Visual Studio 2015` only supports `OpenMP 2.0`. Quantum++ uses features from `OpenMP 3.0`, hence Quantum++ will not compile on `Visual Studio 2015` if you enable `OpenMP` (disabled by default) in

\*Project/Properties/Configuration Properties/C\_C++/Language/Open MP Support\*

and `#define WITH_OPENMP_` in your source file.

- To create a `Visual Studio 2015` or later console solution, start by creating a *Win32 Console Application*

\*File/New/Project.../Installed/Templates/Visual C++/Win32/Win32 Console Application\*

Click `*Next*` then select `*Console Application*` as `*Application Type*`.  
Click `*Finish*` to create the solution. Next select

\*Project/Properties\*

from the main menu. The `*Property Pages*` configuration window will open.  
From the latter select `*All configurations*` from the top left  
`*Configuration*` drop box. Next select

`*Configuration Properties/C_C++/General*`

and add to the field `*Additional Include Directories*` the location of  
Quantum++ `'./include'` folder as well as the location of  
[Eigen 3] (<http://eigen.tuxfamily.org>). It should look similar to

`**C:\Users\User\Downloads\eigen;C:\Users\User\Downloads\qpp\include;%%(AdditionalIncludeDirectories)**`

Finally select

`*Configuration Properties/C_C++/Advanced*`

and add to the field `*Disable Specific Warnings*` the values `**4503;4996**`.  
Click `*Ok*` to save the settings and close the `*Property Pages*` window.  
You are now ready to go.

## OS X/macOS

- If you want to compile with `clang++` version 3.7 or later, I highly recommend to install it via `macports`.
- If you run the program with `MATLAB` support, make sure that the environment variable `DYLD_LIBRARY_PATH` is set to point to the `MATLAB` compiler library location, see the `run_mac_MATLAB` script. Otherwise, you get a runtime error similar to

> dyld: Library not loaded: @rpath/libmat.dylib.

- I recommend running via a script, as otherwise setting the `DYLD_LIBRARY_PATH` globally may interfere with `macports`' `CMake` installation (in case you use `CMake` from `macports`). If you use a script, then the environment variable is local to the script and does not interfere with the rest of the system.

- Example of script, assumed to be located in the root directory of Quantum++

```
#!/bin/sh

MATLAB=/Applications/MATLAB_R2016a.app
export DYLD_LIBRARY_PATH=$DYLD_LIBRARY_PATH:$MATLAB/bin/maci64

./build/qpp
```

- If you build a debug version with `g++` and use `gdb` to step inside template functions you may want to add `-fno-weak` compiler flag. See <http://stackoverflow.com/questions/23330641/gnu-gdb-can-not-step-into-template-functions> for more details about this problem.

## Unit testing

Quantum++ was extensively tested under multiple flavours of Linux, OS X/macOS, Windows XP/7/10, Solaris 11.x via a suite of unit tests constructed with Google Test 1.8.0 (included with the project in ./unit\_tests/lib/gtest-1.8.0). The source code of the unit tests is provided under ./unit\_tests/tests. To build and run the unit tests, I strongly recommend to use CMake version 3.0 or later. Assuming you do use CMake, switch to the ./unit\_tests directory, create a build directory inside it, then from the newly created ./unit\_tests/build type

```
cmake ..  
make
```

The commands above build ./unit\_tests/build/tests/qpp\_testing, which you then may run. Note that `qpp::Timer` tests or tests related to random functions such as `qpp::rand()` may sometime (very rarely) fail, due to timing imprecision or statistical errors. Such behaviour is perfectly normal.

### Note

The CMake configuration file ./unit\_tests/CMakeLists.txt defines the same building options and default choices as the main ./CMakeLists.txt of Quantum++. Therefore you can use the same flags as the ones mentioned at the beginning of this document when customizing the build. You should modify ./unit\_tests/CMakeLists.txt accordingly in case your Eigen 3 library or MATLAB include/library files are in a different location than the one assumed in this document.

## Additional remarks

- If you use clang++ version 3.7 or later and want to use OpenMP (enabled by default), make sure to modify CLANG\_LIBOMP and CLANG\_LIBOMP\_INCLUDE in CMakeLists.txt so they point to the correct location of the OpenMP library, as otherwise clang++ will not find <omp.h> and the libomp shared library.

### 7.10.1 Detailed Description

Base class for generating Quantum++ custom exceptions.

Derive from this class if more exceptions are needed, making sure to override `qpp::exception::Exception::type_description()` in the derived class and to inherit the constructor `qpp::exception::Exception::Exception()`. Preferably keep your newly defined exception classes in the namespace `qpp::exception`.

Example:

```

namespace qpp
{
namespace exception
{
    class ZeroSize : public Exception
    {
    public:
        std::string type_description() const override
        {
            return "Object has zero size";
        }

        // inherit the base class' qpp::exception::Exception constructor
        using Exception::Exception;
    };
} // namespace exception
} // namespace qpp
  
```

## 7.10.2 Constructor & Destructor Documentation

    const std::vector< idx > & ctrl,
    const std::vector< idx > & subsys,
    idx N,

```

Generates the multi-partite multiple-controlled-*A* gate in matrix form.

#### See also

[qpp::applyCTRL\(\)](#)

#### Note

The dimension of the gate *A* must match the dimension of *subsys*

#### Parameters

<i>A</i>	Eigen expression
<i>ctrl</i>	Control subsystem indexes
<i>subsys</i>	Subsystem indexes where the gate <i>A</i> is applied
<i>N</i>	Total number of subsystems
<i>d</i>	Subsystem dimensions

#### Returns

CTRL-*A* gate, as a matrix over the same scalar field as *A*

#### 7.11.3.2 expandout() [1/3]

```
template<typename Derived >
dyn_mat<typename Derived::Scalar> qpp::Gates::expandout (
    const Eigen::MatrixBase< Derived > & A,

    const std::vector< idx > & dims ) const [inline]
```

Expands out.

#### See also

[qpp::kron\(\)](#)

Expands out *A* as a matrix in a multi-partite system. Faster than using [qpp::kron\(I, I, ..., I, A, I, ..., I\)](#).

**Parameters**

<i>A</i>	Eigen expression
<i>pos</i>	Position
<i>dims</i>	Dimensions of the multi-partite system

**Returns**

Tensor product  $I \otimes \cdots \otimes I \otimes A \otimes I \otimes \cdots \otimes I$ , with  $A$  on position  $pos$ , as a dynamic matrix over the same scalar field as  $A$

**7.11.3.3 `expandout()` [2/3]**

```
template<typename Derived >
dyn_mat<typename Derived::Scalar> qpp::Gates::expandout (
    const Eigen::MatrixBase< Derived > & A,
    idx pos,
    const std::initializer_list< idx > & dims ) const [inline]
```

Expands out.

**See also**

[qpp:kron\(\)](#)

Expands out  $A$  as a matrix in a multi-partite system. Faster than using [qpp:kron\(I, I, ..., I, A, I, ..., I\)](#).

**Note**

The `std::initializer_list` overload exists because otherwise, in the degenerate case when `dims` has only one element, the one element list is implicitly converted to the element's underlying type, i.e. `qpp:idx`, which has the net effect of picking the wrong (non-vector) `qpp:expandout()` overload

**Parameters**

<i>A</i>	Eigen expression
<i>pos</i>	Position
<i>dims</i>	Dimensions of the multi-partite system

**Returns**

Tensor product  $I \otimes \cdots \otimes I \otimes A \otimes I \otimes \cdots \otimes I$ , with  $A$  on position  $pos$ , as a dynamic matrix over the same scalar field as  $A$

7.11.3.4 `expandout()` [3/3]

```
template<typename Derived >
dyn_mat<typename Derived::Scalar> qpp::Gates::expandout (
    const Eigen::MatrixBase< Derived > & A,
    idx pos,
    idx N,
    idx d = 2 ) const [inline]
```

Expands out.

#### See also

[qpp::kron\(\)](#)

Expands out  $A$  as a matrix in a multi-partite system. Faster than using [qpp::kron\(I, I, ..., I, A, I, ..., I\)](#).

#### Parameters

$A$	Eigen expression
$pos$	Position
$N$	Number of subsystems
$d$	Subsystem dimension

#### Returns

This class defines friend inline std::ostream& operator<< (std::ostream& os, const **qpp::IDisplay**& rhs). The latter delegates the work to the pure private function **qpp::IDisplay::display()** which has to be overridden by all derived classes.

### 7.12.2 Constructor & Destructor Documentation

#### 7.12.2.1 **IDisplay()** [1/3]

```
qpp::IDisplay::IDisplay ( ) [default]
```

Default constructor.

#### 7.12.2.2 **IDisplay()** [2/3]

```
qpp::IDisplay::IDisplay (
    const IDisplay & ) [default]
```

Default copy constructor.

#### 7.12.2.3 **IDisplay()** [3/3]

```
qpp::IDisplay::IDisplay (
    IDisplay && ) [default]
```

Default move constructor.

#### 7.12.2.4 ~IDisplay()

```
virtual qpp::IDisplay::~IDisplay ( ) [virtual], [default]
```

### 7.12.3 Member Function Documentation

#### 7.12.3.1 display()

```
virtual std::ostream& qpp::IDisplay::display (
    std::ostream & os ) const [private], [pure virtual]
```

Must be overridden by all derived classes.

The actual stream extraction processing is performed by the overriden member function in the derived class. This function is automatically invoked by friend inline std::ostream& operator<<(std::ostream& os, const [IDisplay](#)& rhs).

Implemented in [qpp::internal::IOManipEigen](#), [qpp::Timer< T, CLOCK\\_T >](#), [qpp::internal::IOManipPointer< PointerType >](#), and [qpp::internal::IOManipRange< InputIterator >](#).

#### 7.12.3.2 operator=() [1/2]

```
IDisplay& qpp::IDisplay::operator= (
    const IDisplay & ) [default]
```

Default copy assignment operator.

#### 7.12.3.3 operator=() [2/2]

```
IDisplay& qpp::IDisplay::operator= (
    IDisplay && ) [default]
```

Default move assignment operator.

### 7.12.4 Friends And Related Function Documentation

#### 7.12.4.1 operator<<

```
std::ostream& operator<< (
    std::ostream & os,
    const IDisplay & rhs ) [friend]
```

Overloads the extraction operator.

Delegates the work to the virtual function [qpp::IDisplay::display\(\)](#)

### 7.41.1 Detailed Description

Singleton class that manages the source of randomness in the library.

Consists of a wrapper around an std::mt19937 Mersenne twister random number generator engine and an std::random\_device engine. The latter is used to seed the Mersenne twister.

#### Warning

This class DOES NOT seed the standard C number generator used by Eigen::Matrix::Random(), since it is not thread safe. Do not use Eigen::Matrix::Random() or functions that depend on the C style random number engine, but use [qpp::rand\(\)](#) instead!

### 7.42.1 Detailed Description

```
template<typename T>
class qpp::internal::Singleton< T >
```

[Singleton](#) policy class, used internally to implement the singleton pattern via CRTP (Curiously recurring template pattern)

To implement a singleton, derive your class from [qpp::internal::Singleton](#), make [qpp::internal::Singleton](#) a friend of your class, then declare the constructor and destructor of your class as private. To get an instance, use the static member function [qpp::internal::Singleton::get\\_instance\(\)](#) ([qpp::internal::Singleton::get\\_thread\\_local\\_instance\(\)](#)), which returns a reference (thread\_local reference) to your newly created singleton (thread-safe in C++11).

Example:

```

class MySingleton: public qpp::internal::Singleton<MySingleton>
{
    friend class qpp::internal::Singleton<MySingleton>;
public:
    // Declare all public members here
private:
    MySingleton()
    {
        // Implement the constructor here
    }
    ~MySingleton()
    {
        // Implement the destructor here
    }
};

MySingleton& mySingleton = MySingleton::get_instance(); // Get an instance
thread_local MySingleton& tls = MySingleton::get_thread_local_instance();
// Get a thread_local instance

```
