Chapter 1

Quantum++

Version 1.0.0-beta2 - 13 October 2016

Quantum++ is a modern C++11 general purpose quantum computing library, composed solely of template header files. Quantum++ is written in standard C++11 and has very low external dependencies, using only the [Eigen 3](#) linear algebra header-only template library and, if available, the [OpenMP](#) multi-processing library.

Quantum++ is not restricted to qubit systems or specific quantum information processing tasks, being capable of simulating arbitrary quantum processes. The main design factors taken in consideration were the ease of use, high portability, and high performance.

If you are interesting in contributing, please contact me. To contribute, you need to have a good knowledge of C++ (preferably C++11), including templates and the standard library, a basic knowledge of quantum computing and linear algebra, and working experience with [Eigen 3](#).

For additional [Eigen 3](#) documentation see <http://eigen.tuxfamily.org/dox/>. For a simple [Eigen 3](#) quick ASCII reference see <http://eigen.tuxfamily.org/dox/AsciiQuickReference.txt>.

Building instructions

Configuration

- Compiler: [g++](#) version 4.8.2 or later (for good C++11 support)
- [Eigen 3](#) library located in \$HOME/eigen
- Quantum++ library located in \$HOME/qpp

Optional

- [MATLAB](#) compiler include header files: /Applications/MATLAB_R2016a.app/extern/include
- [MATLAB](#) compiler shared library files: /Applications/MATLAB_R2016a.app/bin/maci64

Building using CMake (version 3.0.0 or later)

The current version of the repository has a `./CMakeLists.txt` configuration file for building examples using CMake. To build an example using CMake, I recommend an out-of-source build, i.e., from the root of the project (where `./include` is located), type

```
mkdir ./build
cd ./build
cmake ..
make
```

The commands above build the release version (default) executable `qpp`, from the source file `./examples/minimal.cpp`, without MATLAB support (default), inside the directory `./build`. To build a different configuration, e.g. debug version with MATLAB support, type from the root of the project

```
cd ./build
rm -rf *
cmake -DCMAKE_BUILD_TYPE=Debug -DWITH_MATLAB=ON ..
make
```

Or, to disable OpenMP support (enabled by default), type

```
cd ./build
rm -rf *
cmake -DWITH_OPENMP=OFF ..
make
```

To change the name of the example file, the location of the Eigen 3 library or the location of MATLAB installation, edit the `./CMakeLists.txt` file. See also `./CMakeLists.txt` for additional options. Do not forget to clean the `./build` directory before a fresh build!

Building without an automatic build system

- Example file: `$HOME/qpp/examples/minimal.cpp`
- Output executable: `$HOME/qpp/examples/minimal`
- You must run the commands below from inside the directory `$HOME/qpp/examples`

Release version (without MATLAB support)

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
-O3 -DNDEBUG -DEIGEN_NO_DEBUG \
-isystem $HOME/eigen -I $HOME/qpp/include \
minimal.cpp -o minimal
```

Debug version (without MATLAB support)

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
-g3 -DDEBUG \
-isystem $HOME/eigen -I $HOME/qpp/include \
minimal.cpp -o minimal
```

Release version (with MATLAB support)

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
-O3 -DNDEBUG -DEIGEN_NO_DEBUG \
-isystem $HOME/eigen -I $HOME/qpp/include \
-I/Applications/MATLAB_R2016a.app/extern/include \
-L/Applications/MATLAB_R2016a.app/bin/mac64 \
-lmx -lmat minimal.cpp -o minimal
```

Debug version (with MATLAB support)

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
-g3 -DDEBUG \
-isystem $HOME/eigen -I $HOME/qpp/include \
-I /Applications/MATLAB_R2016a.app/app/extern/include \
-L /Applications/MATLAB_R2016a.app/app/bin/mac64 \
-lmx -lmat minimal.cpp -o minimal
```

Unit testing

Quantum++ was extensively tested via a suite of unit tests constructed with [Google Test 1.8.0](#) (included with the project in `./unit_tests/lib/gtest-1.8.0`). The source code of the unit tests is provided under `./unit_tests/tests`. To build and run the unit tests, I strongly recommend to use [CMake](#) version 3.0.0 or later. Assuming you do use [CMake](#), switch to the `./unit_tests` directory, create a `build` directory inside it, then from the newly created `./unit_tests/build` type

```
cmake ..
make
```

The commands above build `./unit_tests/build/tests/qpp_testing`, which you then may run.

Note

The [CMake](#) configuration file `./unit_tests/CMakeLists.txt` defines the same building options and default choices as the main `./CMakeLists.txt` of Quantum++. Therefore you can use the same flags as the ones mentioned at the beginning of this document when customizing the build. You should modify `./unit_tests/CMakeLists.txt` accordingly in case your [Eigen 3](#) library or [MATLAB](#) include/library files are in a different location than the one assumed in this document.

Additional remarks

- The C++ compiler must be C++11 compliant.
- If using [Windows](#), I recommend compiling under [cygwin](#) via [CMake](#) and `g++`. See also <http://stackoverflow.com/questions/28997206/cygwin-support-for-c11-in-g4-9-2> for a bug related to lack of support for some C++11 math functions, and how to fix it. Quick fix: patch the standard library header file `<cmath>` using the provided patch `./cmath_cygwin.patch`.
- If your compiler does not support [OpenMP](#) (as it is the case e.g with [clang++](#) pre version 3.7), disable [OpenMP](#) in your build, as otherwise the linker may not find the `gomp` library.
- If you run the program on [OS X](#) with [MATLAB](#) support, make sure that the environment variable `DYLD_LIBRARY_PATH` is set to point to the [MATLAB](#) compiler library location, see the `run OSX MATLAB` script. Otherwise, you get a runtime error similar to

```
> dyld: Library not loaded: @rpath/libmat.dylib.
```

- I recommend running via a script, as otherwise setting the `DYLD_LIBRARY_PATH` globally may interfere with [macports](#)' [CMake](#) installation (in case you use [CMake](#) from [macports](#)). If you use a script, then the environment variable is local to the script and does not interfere with the rest of the system.
- Example of script, assumed to be located in the root directory of Quantum++

```
#!/bin/sh

MATLAB=/Applications/MATLAB_R2016a.app
export DYLD_LIBRARY_PATH=$DYLD_LIBRARY_PATH:$MATLAB/bin/mac64

./build/qpp
```

- If you build a debug version with `g++` under [OS X](#) and use `gdb` to step inside template functions you may want to add `-fno-weak` compiler flag. See <http://stackoverflow.com/questions/23330641/gnu-gdb-can-not-step-into-template-functions-os-x-mavericks> for more details about this problem.

7.5.1 Detailed Description

Abstract class (interface) that mandates the definition of virtual std::ostream& `display(std::ostream& os) const`.

This class defines friend inline std::ostream& operator<< (std::ostream& os, const `qpp::IDisplay& rhs`). The latter delegates the work to the pure virtual function `qpp::IDisplay::display()` which has to be overridden by all derived classes.

7.5.2 Constructor & Destructor Documentation

7.16.1 Detailed Description

Singleton class that manages the source of randomness in the library.

Consists of a wrapper around an std::mt19937 Mersenne twister random number generator engine and an std::random_device engine. The latter is used to seed the Mersenne twister.

Warning

This class DOES NOT seed the standard C number generator used by Eigen::Matrix::Random(), since it is not thread safe. Do not use Eigen::Matrix::Random() or functions that depend on the C style random number engine, but use [qpp::rand\(\)](#) instead!

7.17.1 Detailed Description

```
template<typename T> class qpp::internal::Singleton< T >
```

[Singleton](#) policy class, used internally to implement the singleton pattern via CRTP (Curiously recurring template pattern)

To implement a singleton, derive your class from [qpp::internal::Singleton](#), make [qpp::internal::Singleton](#) a friend of your class, then declare the constructor and destructor of your class as private. To get an instance, use the static member function [qpp::internal::Singleton::get_instance\(\)](#) ([qpp::internal::Singleton::get_thread_local_instance\(\)](#)), which returns a reference (thread_local reference) to your newly created singleton (thread-safe in C++11).

Example:

```
class MySingleton: public qpp::internal::Singleton<MySingleton>
{
    friend class qpp::internal::Singleton<MySingleton>;
public:
    // Declare all public members here
private:
    MySingleton()
    {
        // Implement the constructor here
    }
    ~MySingleton()
    {
        // Implement the destructor here
    }
};

MySingleton& mySingleton = MySingleton::get_instance(); // Get an instance
thread_local MySingleton& tls = MySingleton::get_thread_local_instance();
// Get a thread_local instance
```
