### **Abstract**

The Kernel Adaptive Filtering Toolbox is a benchmarking toolbox to evaluate and compare kernel adaptive filtering algorithms in Matlab. Kernel adaptive filtering algorithms are online machine learning techniques suitable for nonlinear filtering, prediction, tracking and regression. This toolbox contains implementations of all major kernel adaptive filtering algorithms, and tools to measure and compare the performance, memory usage, speed and other properties.

# Chapter 1

## Introduction

### 1.1 Goals of the toolbox

The goals of this toolbox are twofold:

1. To provide a repository for Matlab implementations of kernel adaptive filtering algorithms;
2. To provide tools that allow to compare all aspects of the different algorithms.

A list of the included algorithms and tools can be found in Chapter 5.

## Chapter 2

# First use

### 2.1 Installation

1. Download the toolbox and run the `installation.m` file in the root folder.
2. Type `savepath` to save the changes to the path.

### 2.2 Directories included in the toolbox

- `data/` contains data sets.
- `demo/` contains demos and test files.
- `doc/` contains the documentation for the toolbox.
- `lib/` contains the algorithm libraries and utilities.

### 2.3 Versions and compatibility

KAFBOX uses the `classdef` command which is not supported in Matlab pre-2008a and not yet in Octave. The older 0.x versions of this toolbox do not use `classdef` and can therefore be used with all versions of Matlab and Octave. <https://github.com/steven2358/kafbox/releases/>

The current version of KAFBOX is v2.

## Chapter 3

# Kernel adaptive filtering

### 3.1 Framework for online kernel methods

Online learning methods update their solution iteratively. In the standard online learning framework, each iteration consists of several trials [Blu98]. During the  $n$ -th iteration:

1. The algorithm first receives an input datum,  $\mathbf{x}_n$ ;
2. Then, it calculates the estimated output  $\hat{y}_n$  corresponding to this datum.
3. The true outcome  $y_n$  is made available shortly thereafter, which enables the algorithm to calculate the loss  $L(\cdot)$  incurred on the data pair  $(\mathbf{x}_n, y_n)$ ;
4. Finally, the solution is updated.

A typical setup for online system identification with a kernel-based method is depicted in Fig. 3.1. It represents an unknown nonlinear system, whose input data  $\mathbf{x}_n$  and response  $y_n$  (including additive noise  $r_n$ ) can be measured at different time steps, and an adaptive kernel-based algorithm, which is used to identify the system's response.

Online algorithms should be capable of operating during extended periods of time, processing large amounts of data. Kernel methods rely on a functional representation that grows as the amount of observations increases. A naïve implementation of an online kernel method will therefore require growing computational resources during operation, leading to performance issues once the available memory is insufficient to store the training data or once the computations for one update take more time than the interval between incoming data [KSW04].

### 3.2 Kernel adaptive filtering algorithms

Kernel adaptive filtering algorithms are online machine learning algorithms that build the solution to a regression or classification problem. While early kernel

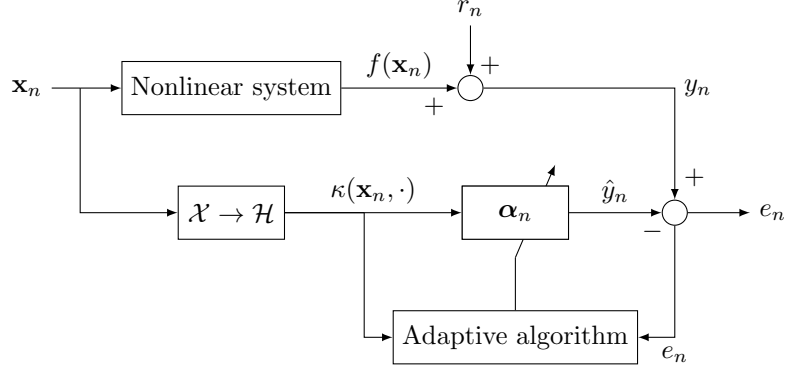

Figure 3.1: Kernel-based adaptive system identification. Figure adapted from [PBRT12].

adaptive filtering algorithms had a clear connection to classical adaptive filters, such as LMS, RLS and KAPA filters, later implementations explored Gaussian process, projections-based and multi-kernel algorithms.

The different kernel adaptive filtering algorithms proposed in the literature vary in several aspects:

- The type of filter they relate to: typically LMS, RLS or KAPA;
- The computational complexity w.r.t. the amount of elements in memory,  $M$ : typically  $\mathcal{O}(M)$  or  $\mathcal{O}(M^2)$ ;
- The approach to building a sparse dictionary and to possible prune data from it afterwards;
- The convergence speed;
- The ability to employ multiple kernels and learn their respective weights.

The algorithm profiler described in Chapter 4 allows to compare these different aspects empirically.

### 3.3 Algorithm code structure

Since all algorithms share the same structure, they are coded in a common framework. In particular:

- Each algorithm is contained in a single file in the `/lib` folder.
- Each algorithm is implemented as an object in matlab, using the `classdef` syntax.

- Each algorithm has two basic public methods: `evaluate` and `train`. The object code contains only one iteration of the algorithm. The for-loop over the time index that governs the online operation should go in an external script.

Furthermore, efforts are made to make the code

1. As human-readable as possible, in the first place;
2. Short and structured, in the second place.

As far as possible, algorithm structure should follow the pseudocode from the corresponding publication.

Finally, the following best practices for scientific computing are taken into account [WAB<sup>+</sup>14]:

- Variable naming should correspond to the nomenclature used in the corresponding publication whenever possible;
- Comments should be used sparingly. Document the design and purpose of the code rather than its mechanics.

### 3.4 Template for kernel adaptive filtering algorithms

```

1  % This is the template used for kernel adaptive filtering algorithms in
2  % the kernel adaptive filtering toolbox. [Delete this line.]
3  %
4  % [The name of the algorithm goes here]
5  %
6  % [A reference to the original publication of the algorithm goes here,
7  % including a link to its DOI url: http://dx.doi.org/xxx]
8  %
9  % This file is part of the Kernel Adaptive Filtering Toolbox for Matlab.
10 % https://github.com/steven2358/kafbox/
11
12 classdef kafbox_template < handle
13
14     properties (GetAccess = 'public', SetAccess = 'private') % parameters
15         param1 = 1;
16         param2 = 2;
17         kerneltype = 'gauss'; % kernel type
18         kernelpar = 1; % kernel parameter
19     end
20
21     properties (GetAccess = 'public', SetAccess = 'private') % variables
22         dict = []; % dictionary
23         alpha = []; % expansion coefficients
24     end
25
26     methods
27         function kaf = kafbox_template(parameters) % constructor

```

```

28         if (nargin > 0) % copy valid parameters
29             for fn = fieldnames(parameters)',
30                 if ismember(fn,fieldnames(kaf)),
31                     kaf.(fn{1}) = parameters.(fn{1});
32                 end
33             end
34         end
35     end
36
37     function y_est = evaluate(kaf,x) % evaluate the algorithm
38         if size(kaf.dict,1)>0
39             k = kernel(kaf.dict,x,kaf.kerndtype,kaf.kerndpar);
40             y_est = k'*kaf.alpha;
41         else
42             y_est = zeros(size(x,1),1);
43         end
44     end
45
46     function train(kaf,x,y) % train the algorithm
47         if size(kaf.dict,2)==0 % initialize
48             kaf.dict = x;
49             kaf.alpha = 0;
50         else
51             % [main algorithm training goes here]
52
53             % [example of a helper function]
54             z = kaf.helper1(x,y);
55         end
56     end
57
58     end
59 end
60
61 methods (Static = true) % [helper functions go here]
62     function z = helper1(x,y)
63         z = x*y;
64         % operations
65     end
66 end
67 end

```

### 3.5 Performing online learning

Each kernel adaptive filtering algorithm is implemented as a Matlab class. To perform online learning with an algorithm, first define its options:

```
options = struct('nu',1E-4,'kerndtype','gauss','kerndpar',32);
```

Next, create an instance of the filter. E.g., for an instance of the KRLS algorithm that uses the ALD criterion run:

```
kaf = aldkrls(options);
```

One iteration of training is performed by feeding one input-output data pair to the filter:

```
kaf.train(x,y);
```

The outputs for one or more test inputs are evaluated as follows:

```
Y_test = kaf.evaluate(X_test);
```

### 3.6 Example learning script: time-series prediction

```
1 % 1-step ahead prediction on Lorenz attractor time-series data
2 %
3 % This file is part of the Kernel Adaptive Filtering Toolbox for Matlab.
4 % https://github.com/steven2358/kafbox/
5
6 [X,Y] = kafbox_data(struct('name','Lorenz','embedding',6));
7
8 % make a kernel adaptive filter object of class krls with options:
9 % ALD threshold 1E-4, Gaussian kernel, and kernel width 32
10 kaf = krls(struct('nu',1E-4,'kerneltype','gauss','kernelpar',32));
11
12 %% RUN ALGORITHM
13 N = size(X,1);
14 Y_est = zeros(N,1);
15 for i=1:N,
16     if ~mod(i,floor(N/10)), fprintf('.'); end % progress indicator, 10 dots
17     Y_est(i) = kaf.evaluate(X(i,:)); % predict the next output
18     kaf.train(X(i,:),Y(i)); % train with one input-output pair
19 end
20 fprintf('\n');
21 SE = (Y-Y_est).^2; % test error
22
23 %% OUTPUT
24 fprintf('MSE after first 1000 samples: %.2fdB\n\n',10*log10(mean(SE(1001:end))));
```

## Chapter 4

# Algorithm profiler

The algorithm profiler is a tool that allows to compare the trade-off between cost and performance between several algorithm configurations and/or several algorithms.

A demo configuration script is given in the file  
`demo/demo_profiler_prediction_lorenz.m`.

## Chapter 5

# List of included algorithms

Matlab implementations of the following algorithms are included in the toolbox:

- Approximate Linear Dependency Kernel Recursive Least-Squares (ALD-KRLS) [EMM04].
- Sliding-Window Kernel Recursive Least-Squares (SW-KRLS) [VVVS06].
- Naive Online Regularized Risk Minimization Algorithm (NORMA) [KSW04].
- Kernel Least-Mean-Square (KLMS) [LPP08].
- Fixed-Budget Kernel Recursive Least-Squares (FB-KRLS) [VVSLP10].
- Kernel Recursive Least-Squares Tracker (KRLS-T) [VVLGS12].
- Quantized Kernel Least Mean Squares (QKLMS) [CZZP12].
- Random Fourier Feature Kernel Least Mean Square (RFF-KLMS) algorithm [SAM12].
- Extended Kernel Recursive Least Squares (EX-KRLS) [LPWP09].
- Gaussian-Process based estimation of the parameters of KRLS-T [VVSLG12].
- Kernel Affine Projection (KAP) algorithm with Coherence Criterion [RBH09].
- Kernel Normalized Least-Mean-Square (KNLMS) algorithm with Coherence Criterion [RBH09].
- Recursive Least-Squares algorithm with exponential weighting (RLS) [Say03].
- Multikernel Normalized Least Mean Square algorithm with Coherence-based Sparsification (MKNLMS-CS) [Yuk12].
- Parallel HYperslab Projection along Affine SubSpace (PHYPASS) algorithm [TY13].

- Fixed-budget kernel least mean squares (FB-KLMS) algorithm [Rze12].
- Leaky Kernel Affine Projection Algorithm (LKAPA, including KAPA-1 and KAPA-3) and Normalized Leaky Kernel Affine Projection Algorithm (NLKAPA, including KAPA-2 and KAPA-4) [LPP08].
- Kernel Affine Projection Subgradient Method (KAPSM) [STY08].
- Kernel Least Mean Squares algorithm with Coherence-Sparsification criterion and L1-norm regularization (KLMS-CSL1) and with active L1-norm regularization (KLMS-CSAL1) [GCR<sup>+</sup>13].
- Mixture Kernel Least Mean Square (MxKLMS) algorithm [PSP13].
- Fixed budget quantized kernel least-mean-square algorithm (QKLMS-FB) [ZCZP13]
- Probabilistic Least-Mean-Squares (ProbLMS) algorithm [FBEVV15].
- Discrete-time Kalman filter [Kal60].

# Chapter 6

## About

- **Name:** Kernel Adaptive Filtering Toolbox
- **Abbreviation:** KAFBOX
- **Current version:** v2
- **Punchline:** a Matlab benchmarking toolbox for kernel adaptive filtering
- **Author:** Steven Van Vaerenbergh
  - Homepage: <http://gtas.unican.es/people/steven/>
  - Email: [steven.vanvaerenbergh@unican.es](mailto:steven.vanvaerenbergh@unican.es)
  - Affiliation: Advanced Signal Processing Group, Department of Communications Engineering, University of Cantabria, Spain.
- **Collaborators:** Miguel Lazaro-Gredilla, Sohan Seth, Masahiro Yukawa, Masa-aki Takizawa, Osamu Toda, Dominik Rzepka, Pantelis Bouboulis, Stephan Rhode
- **URL:** <https://github.com/steven2358/kafbox/>
- **Citing:** Published reports of research using this code (or a modified version) should cite [VVS13].
- **Environment:** Matlab<sup>1</sup>.
- **Origin:** KAFBOX is a fork of Kernel Methods Toolbox (KMBOX) v0.6 (<http://sourceforge.net/p/kmbox/>)
- **Extending the code:** Template files are provided to encourage external authors to include their own code into the toolbox. Contributions can be made through Github's fork and pull system.
- **License:** FreeBSD
