[General Discussion](#)

## Introduction

The framework is developed for rapid development of Enterprise application on the C++ platform. It is a c++ web framework, c++ application framework, c++ rest framework, c++ security framework and c++ soap framework all bundled into one. It consists of the following and is currently implemented for **LINUX/FREEBSD/WINDOWS(Cygwin)/SOLARIS**. It is the **first and only** C++ Application framework to provide **non-intrusive Dependency Injection and Business Driven Component Logic and POCO based Development**. Most of the features are controlled by configuration files.

## Features

- Easy to use **View Framework**
- **SSL Support** available
- **Web Server** (Multi process, Multi Threaded – EPOLL based)
- Inbuilt Authentication handlers and **OAUTH** support
- Configuration driven URL mapping
- **Dependency Injection** (constructor and setter injection)
- **ORM** library (currently implemented for MySQL, Integrated with STL, Table mappings through configuration files → One – Many, Many – Many, One – One. The ORM Can be easily extended to other Databases).
- **SOAP Integration** (Web Service implementation through configuration file → Methods in a C++ header file exposed as Web-Services)
- **REST** Controller framework (pretty URL's)
- **AJAX** Integration (Using property based configuration - On the lines of DWR for Java – > Just define C++ header files and Methods will be exposed as AJAX calls)
- **EJB styled Beans** (Remote and Local Interfaces exposed → C++ files have the services, and the methods to be exposed are defined in a configuration file)
- **Universal Object type** for C++ (intelligent pointer - no need of extending any class – identifies the object type)
- XML based **Serialization** (Limited → only for single level /no nesting of objects - header files required)
- **Reflection** (Limited → header files required)
- **Dynamic C++ Pages** (Mix HTML and C++ code to produce run time views without web server restart)
- **Template Engine** and **Dynamic Views** generated from C++ objects.
- **Controller Pattern** (Implement controllers mapped with URL patterns to define custom behaviors)
- **Request/Response Filters** (Implement a chain of custom Filters for Pre/Post processing of request/response)
- **Thread Pool** Implementation
- **C++ Interpreter** (Limited support)
- **Rule based WEB** Behavior (idea can be expanded to other areas application wide)
- XML Parser (DOM Styled)
- Database Connection Pooling
- **Internationalization** support
- Utilities such as Timer, Logging, Property Files etc.
- File Upload
- FTP Server
- **ROLE based Security** features for Method access (Web Services, AJAX calls, C++ Bean service calls, Server URL's)
- **Module** for Integration of the framework with **Apache Web Server**
- **Method Invoker** Server for cross platform Method Invocation (A daemon per language/platform approach – XML based Serialization/De- Serialization)

## InstallationDirections

Installing ffeed-server on GNU/Linux

Featured, Phase-Deploy

Updated Mar 22, 2012 by [surmeet.chhetri@gmail.com](mailto:surmeet.chhetri@gmail.com)

## GNU/Linux based Installation

- Follow [Windows/Cygwin Install](#) for directions on how to install on Windows and Cygwin
- Download the tar file and extract it to the location of your choice.
- Make sure **boost**  $\geq$  **v1.4** libraries and boost devel packages are installed on your system
- Install **Unix-ODBC** and required odbc files for **MySQL** dependency
- Install **Open-SSL** as well
- [JSON-SPIRIT](#) source and header files are already included in the source code distribution
- Also included **prototype.js** in source for AJAX support
- Go to the ffeed-server/Release or ffeed-server/Debug depending on whether you need to debug the server code
- Open terminal and type **make all**
- This will create the distribution folder named ffeed-server inside ffeed-server/Release or ffeed-server/Debug folders accordingly
- Place your application shared library inside the ffeed-server/Release/ffead-server or ffeed-server/Debug/ffead-server folder.
- Place your web application specific files inside the ffeed-server/Release/ffead-server/web folder inside a folder with your application name
- Type **./server.sh** when inside the ffeed-server folder to start the application server
- A default application is already provided for your reference inside the ffeed-server/web folder
- To compile the default application shared library go to the ffeed-server/Release/ffead-server/web/default/src/Debug folder and run "make all"
- Copy the libdefault library to the ffeed-server/Release/ffead-server/lib folder

## FreeBSDInstallationDirections

Installing ffead-server-freebsd on FreeBSD

Featured

Updated May 27, 2012 by [surmeet.chhetri@gmail.com](mailto:surmeet.chhetri@gmail.com)

## FreeBSD based Installation

- Follow [Windows/Cygwin Install](#) for directions on how to install on Windows and Cygwin
- Download the tar file and extract it to the location of your choice.
- Make sure **boost** >=v1.4 libraries and boost devel packages are installed on your system(install from ports or use pkg\_add)
- Install **Unix-ODBC** and required odbc files for **MySQL** dependency
- Install **Open-SSL** as well
- **JSON-SPIRIT** source and header files are already included in the source code distribution
- Also included **prototype.js** in source for AJAX support
- Go to the ffead-server-freebsd/Release or ffead-server-freebsd/Debug depending on whether you need to debug the server code
- Open terminal and type **gmake all**
- This will create the distribution folder named ffead-server-freebsd inside ffead-server-freebsd/Release or ffead-server-freebsd/Debug folders accordingly
- Place your application shared library inside the ffead-server-freebsd/Release/ffeadd-server-freebsd or ffead-server-freebsd/Debug/ffeadd-server-freebsd folder.
- Place your web application specific files inside the ffead-server-freebsd/Release/ffeadd-server-freebsd/web folder inside a folder with your application name
- Type **./server.sh** when inside the ffead-server-freebsd folder to start the application server
- A default application is already provided for your reference inside the ffead-server-freebsd/web folder
- To compile the default application shared library go to the ffead-server-freebsd/Release/ffeadd-server-freebsd/web/default/src/Debug folder and run "gmake all"
- Copy the libdefault library to the ffead-server-freebsd/Release/ffeadd-server-freebsd/lib folder
- Remember all installation files(makefile,subdir.mk) assume the ports are installed to the /usr/local/lib directory, in case you choose custom settings during installation of dependencies then make sure to change all files to include the -L/usr/local/lib to -L/location/of your/choice

## SolarisInstallationDirections

*Installing ffead-server-solaris on Solaris*Updated Yesterday (28 hours ago) by [sumeet.chhetri@gmail.com](#)

## Solaris based Installation

- Follow [Windows/Cygwin Install](#) for directions on how to install on Windows and Cygwin
- Download the tar file and extract it to the location of your choice.
- Install the following using the commands mentioned below

System Header files

```
sudo pkg install system/header
```

Install OpenCSW and edit PATH variable for CSW

```
sudo pkgadd -d http://get.opencsw.org/now vi ~/.profile
```

- change the PATH to add /opt/csw/bin before the /usr/bin part - PATH should now look like  
/opt/csw/bin:/usr/bin:/usr/share/bin

Install GCC/UnixODBC and SSL devel and libraries

```
sudo pkgutil -y -i gcc4core gcc4g++ libstdc++6 unixodbc unixodbc_dev libssl1_o_o libssl_dev  
subversion(optional)
```

Install Boost libraries and devel headers

```
wget http://nchc.sourceforge.net/project/boost/boost/1.50.0/boost\_1\_50\_0.tar.bz2 tar xvf  
boost_1_50_0.tar.bz2 cd boost_1_50_0 sudo ./bootstrap.sh sudo ./bjam address-model=64 sudo ./bjam install -  
-prefix=/usr/
```

- JSON-SPIRIT source and header files are already included in the source code distribution
- Also included prototype.js in source for AJAX support
- Go to the ffead-server-solaris/Release or ffead-server-solaris/Debug depending on whether you need to debug the server code
- Open terminal and type gmake all
- This will create the distribution folder named ffead-server-solaris inside ffead-server-solaris/Release or ffead-server-solaris/Debug folders accordingly
- Place your application shared library inside the ffead-server-solaris/Release/ffead-server-solaris/lib or ffead-server-solaris/Debug/ffead-server-solaris/lib folder.
- Place your web application specific files inside the ffead-server-solaris/Release/ffead-server-solaris/web folder inside a folder with your application name
- Type ./server.sh when inside the ffead-server-solaris folder to start the application server
- A default application is already provided for your reference inside the ffead-server-solaris/web folder
- To compile the default application shared library go to the ffead-server-solaris/Release/ffead-server-solaris/web/default/src/Debug folder and run "gmake all"
- Copy the libdefault library to the ffead-server-solaris/Release/ffead-server-solaris/lib folder

## WindowsCygwinInstallationDirections

Installing ffeed-server on Windows and Cygwin

Featured, Phase-Deploy

Updated Jul 30, 2011 by [surmeet.chhetri@gmail.com](mailto:surmeet.chhetri@gmail.com)

### Installation On Windows with Cygwin

- Download Cygwin setup.exe and follow instruction to install Cygwin, proceed with default settings.
- After Cygwin is successfully installed, you can open a cygwin terminal to check whether Cygwin works.
- Run the setup.exe to install further dependencies whenever required.
- Following are the dependencies,
  1. gcc
  2. g++
  3. autoconf
  4. automake
  5. boost libraries and devel
  6. openssl libraries and devel (use Cygwin\_SSL\_UnixOdbc\_libs.zip from downloads section for version 1.0)
  7. unixODBC libraries and devel (not found in Cygwin reposistory, use Cygwin\_SSL\_UnixOdbc\_libs.zip from download section)
  8. bison,yacc,flex,gdb,readline,binutils (for building and installing openssl and unixODBC)
- Copy bin/gcc-3 or bin/gcc-4 and rename it ot gcc (the already existing link file gcc sometimes gives permission errors)
- You can build and install openssl and unixodbc and copy the required library files to the cygwin lib folder. The already built libraries are present in the Cygwin\_SSL\_UnixOdbc\_libs.zip file which can be copied to the lib folder directly.
- Download the latest release tar file and extract it to the location of your choice under Cygwin installation.
- Make sure **boost** libraries are installed on your system
- Install **Unix-ODBC** and required odbc files for **MySQL** dependency
- Install **Open-SSL** as well
- **JSON-SPIRIT** source and header files are already included in the source code distribution
- Also included **prototype.js** in source for AJAX support
- Go to the ffeed-server/Release or ffeed-server/Debug depending on whether you need to debug the server code
- Open terminal and type **make all**
- This will create the distribution folder named ffeed-server inside ffeed-server/Release or ffeed-server/Debug folders accordingly
- Place your application shared library inside the ffeed-server/Release/ffead-server or ffeed-server/Debug/ffead-server folder.
- Place your web application specific files inside the ffeed-server/Release/ffead-server/web folder inside a folder with your application name
- Type **./server.sh** when inside the ffeed-server folder to start the application server
- A default application is already provided for your reference inside the ffeed-server/web folder
- To compile the default application shared library go to the ffeed-server/Release/ffead-server/web/default/src/Debug folder and run "make all"
- Copy the libdefault library to the ffeed-server/Release/ffead-server/lib folder

## QuickStartGuide

Create a new application in minutes

Featured, Phase-Implementation

Updated Today (21 minutes ago) by [surmeet.chhetri@gmail.com](mailto:surmeet.chhetri@gmail.com)

## Quick Start Guide

### BINARY FILE

- Download the ffead-server-`{os}`-bin-v`{version}`.zip file and extract it to the location of your choice.
- Visit the [Installation Directions](#) page for more information
- Go the folder ffead-server.
- Modify ffead-server/resources/server.prop to set the port, default application, number of server processes and other essential attributes [Server-Properties](#)
- Modify ffead-server/resources/log.properties file to enable custom logging for the applications [Logger-Properties](#)
- `chmod 777 ffead-server/server.sh`
- Execute `./server.sh` start the Web Server
- Enter <http://localhost:port/index.html> and Watch the magic!!!

### SOURCE FILE

- Download the ffead-server-`{os}`-src-v`{version}`.zip file and extract it to the location of your choice.
- Visit the [Installation Directions](#) page for more information
- Go the folder ffead-server-`{os}`/Debug or ffead-server-`{os}`/Release folder.
- `chmod 777 makeAll.sh`
- Execute the `./makeAll.sh` file, it will compile and build the complete project and all required web applications
- Go to the ffead-server-`{os}`/Debug/ffead-server or ffead-server-`{os}`/Release/ffead-server folder
- Modify ffead-server/resources/server.prop to set the port, default application, number of server processes and other essential attributes [Server-Properties](#)
- Modify ffead-server/resources/log.properties file to enable custom logging for the applications [Logger-Properties](#)
- `chmod 777 ffead-server/server.sh`
- Execute `./server.sh` start the Web Server
- Enter <http://localhost:port/index.html> and Watch the magic!!!

## NewWebApp

Create a new application in minutes

Updated Today (27 minutes ago) by [sumeet.chhetri@gmail.com](#)

### Add new web application

- Download the tar file and extract it to the location of your choice.
- Visit the [Installation Directions](#) page for more information
- Go the folder ffead-server-unix/Debug/ffead-server.
- Create a new folder in ffead-server/web i.e, appname
- Modify ffead-server/resources/ffead-server.prop to set the port, default application, number of server processes and other essential attributes [Server-Properties](#)
- Create ffead-server/resources/log.properties file to enable custom logging for the applications [Logger-Properties](#)
- Create new folders /lib /components /config /dcp /include under your newly created application folder (appname)
  - ffead-server/web/appname
    1. /lib
    2. /include
    3. /dcp
    4. /config
    5. /components
- Drop all your application level header files intended for Serialization and Reflection enabled support in the /appname/include folder. All files targeted for Web-Services, Ajax, Database mapping, Components, Controllers, Templates, Views etc should have their header definition files present in the /appname/include folder.
- Drop the shared library of your application inside the /appname/lib folder.
- Create/Drop your html/tpe files directly in the /appname folder [Example-tpe-File](#)
- Create/Drop your dcp files in the /appname/dcp folder [Example-dcp-File](#)
- Create /appname/config/cibernate.xml for ORM support [Cibernate-Configuration](#)
- Create /appname/config/application.xml for Dynamic C++ pages, Templates and Dynamic view support [Application-Level-Configuration](#)
- Create /appname/config/afc.properties for Ajax Support [Ajax-Configuration](#)
- Create /appname/config/ws.xml for Web-Service Support [Web-Services-Configuration](#)
- For Business Entities or Business Driven Beans create your custom \*.cmp files and drop them inside the /appname/components folder [Example-Component](#)
- For Dependency Injection create a file named /appname/config/depInj.xml [Example depInj.xml](#)
- Create /appname/config/messaging.xml for Messaging support [Messaging-Configuration](#)
- Create a new HTML page named index.html and place it in your /appname folder
- Restart the Web Server
- Enter <http://localhost:port/appname/> and Watch the magic!!!

## ExampleController

*An Example Controller Implementation*

[ffead](#), [cpp](#), [example](#), [controller](#), [implementation](#)

Updated Jun 30, 2012 by [smeet.chhetri@gmail.com](mailto:smeet.chhetri@gmail.com)

### ExampleController.h

```
#ifndef EXAMPLECONTROLLER_H_
#define EXAMPLECONTROLLER_H_
#include <iostream>
#include "Controller.h"

class ExampleController: public Controller{
public:
    ExampleController();
    virtual ~ExampleController();
    HttpResponse service(HttpRequest);
};
#endif /* EXAMPLECONTROLLER_H_ */
```

### ExampleController.cpp

```
ExampleController::ExampleController()
{}
ExampleController::~ExampleController()
{}
HttpResponse ExampleController::service(HttpRequest request)
{
    /*Play with the request*/
    HttpResponse res;
    /*Modify response*/
    return res;
}
```

### Config for controller in application.xml

```
<controllers>
  <!--Custom controller handling url patterns-->
  <controller class="DefaultController" url="*.action"/>
  <controller class="DefaultController" url="*.do"/>

  <!--Internal controller handling extension conversions-->
  <controller from="*.yourext" to="*.html"/>
</controllers>
```

## ExampleRestController

An Example Rest Controller Implementation  
[restcontroller](#), [implementation](#), [Featured](#)

Updated Jun 30, 2012 by [smeet.chhetri@gmail.com](mailto:smeet.chhetri@gmail.com)

### DefaultRestController.h

```
#ifndef DEFAULTRESTCONTROLLER_H_
#define DEFAULTRESTCONTROLLER_H_

#include "RestController.h"
#include <iostream>
#include <math.h>
class DefaultRestController: public RestController {
public:
    DefaultRestController();
    virtual ~DefaultRestController();
    void addNumbers(int,int);
    void power(int,int);
};

#endif /* DEFAULTRESTCONTROLLER_H_ */
```

### DefaultRestController.cpp

```
#include "DefaultRestController.h"

DefaultRestController::DefaultRestController() {
    // TODO Auto-generated constructor stub
}

DefaultRestController::~DefaultRestController() {
    // TODO Auto-generated destructor stub
}

void DefaultRestController::addNumbers(int a, int b)
{
    int c = a + b;
    response->setStatusCode("200");
    response->setStatusMsg("OK");
    response->setContent_type("text/plain");
    response->setContent_str(boost::lexical_cast<string>(a) + " + " + boost::lexical_cast<string>(b) + " = " +
        boost::lexical_cast<string>(c));
    cout << "Processed input request inside DefaultRestController..." << endl;
}

void DefaultRestController::power(int base, int exponent)
{
    int c = pow(base, exponent);
    response->setStatusCode("200");
    response->setStatusMsg("OK");
    response->setContent_type("text/plain");
    response->setContent_str(boost::lexical_cast<string>(base) + " ^ " + boost::lexical_cast<string>(exponent) + " = " +
        boost::lexical_cast<string>(c));
    cout << "Processed input request inside DefaultRestController..." << endl;
}
```

### Config for rest service in application.xml

```
<restcontrollers>
    <restcontroller class="DefaultRestController" urlpath="/rest/path/" name="rest1">
        <restfunction name="addNumbers" alias="add" meth="GET">
            <param type="int"/>
            <param type="int"/>
        </restfunction>
    </restcontroller>
    <restcontroller class="DefaultRestController" urlpath="/rest/path1/" name="rest2">
        <restfunction name="addNumbers" alias="+" meth="GET">
            <param type="int"/>
            <param type="int"/>
        </restfunction>
    </restcontroller>
    <restcontroller class="DefaultRestController" name="rest3">
```

```
<restfunction name="addNumbers" alias="ad" meth="GET">
  <param type="int"/>
  <param type="int"/>
</restfunction>
</restcontroller>
<restcontroller class="DefaultRestController">
  <restfunction name="power" meth="GET" baseUrl="/rest/controller/base{1}/power/exp{2}">
    <param type="int"/>
    <param type="int"/>
  </restfunction>
</restcontroller>
<restcontroller class="DefaultRestController">
  <restfunction name="addNumbers" meth="GET">
    <param type="int"/>
    <param type="int"/>
  </restfunction>
</restcontroller>
</restcontrollers>
```

## FViews

FFEAD Views

Updated Jul 15, 2011 by [sumeet.chhetri@gmail.com](mailto:sumeet.chhetri@gmail.com)

**FFEAD View** or **FView** is a strategy where major view handling code is generated by the Server, all you need to do is just write plain HTML pages and define a corresponding **fviews.xml** file, it also provides easy javascript ajax methods for DOM events. Arguments to be sent to the server and callback can also be specified.

Every page in the XML file has a backing Page (**TestPage**) class for handling the DOM AJAX events.

You can define Form backing beans in the configuration file (fview.xml) and define your Bean (**TestForm**) class and a controller (**TestFormController**) responsible for handling the Submit action of the form. The Data from the HTML form is automatically converted to the bean class and fed to the controller onSubmit method.

The only point to be noted is that the URL in the action attribute in the form should end with **.form** extension which should also be the case in the xml config file. Also note the mapping of the form input parameter names to the **TestForm** class properties. All javascript functions can be written in the functions tag inside the page element.

HTML Page (test.html)

```
<html>
<head>
</head>
<body>
  <p id="para">sdfsadsa</p>
  <input type="text" value="sdfs" id="text"/>
  <a id="link" href="#">Testing</a>
  <form id="tform" action="/default/test.form" method="get" >
    TextField: <input type="text" value="" name="txtField"/>
    NumField: <input type="text" value="" name="numField"/>
    ChooseField: <select name="selField"><option value="1">One</option><option value="2">Two</option></select>
    <input type="submit" value="Submit"/>
  </form>
</body>
</html>
```

Example fview.xml

```
<fview>
  <page htm="test.html" class="TestPage">
    <event eid="text" type="onclick" func="textonclick" args="1,document.getElementById('link').innerText,'Hello'" cb="alert(response.responseText)"/>
    <event eid="link" type="onclick" func="linkonclick" cb="document.getElementById('para').innerHTML=response;alert(response.responseText)"/>
    <functions>
      <![CDATA[
        function test()
        {
          alert("Hello />");
        }
      ]]>
    </functions>
    <form name="test.form" bean="TestForm" controller="TestFormController">
      <field name="txtField" prop="txt"/>
      <field name="numField" prop="num"/>
      <field name="selField" prop="che"/>
    </form>
  </page>
</fview>
```

TestPage

HEADER FILE

```
#ifndef TESTPAGE_H_
#define TESTPAGE_H_
#include "string"
using namespace std;
class TestPage {

## ExampleThreadPoolUsage

*Example Thread Pool Usage*

cpp, thread, pool, scheduled, priority, direct, ffeed

Updated Aug 16, 2010 by [sumeet.chhetri@gmail.com](mailto:sumeet.chhetri@gmail.com)

### ThreadPoolTest.cpp

```
using namespace std;
using namespace boost;
#include "ThreadPool.h"
#include "boost/lexical_cast.hpp"

class MyTask : public Task
{
public:
    float j;
    MyTask(float j){this->j = j;}
    ~MyTask(){}
    void run()
    {
        cout << "Task run " << j << "\n" << flush;
    }
    string toString()
    {
        return ("Task No "+lexical_cast<string>(j));
    }
};

void testDirectExecution()
{
    /*Declare a Thread Pool with Min 2 and Max 5 Threads*/
    ThreadPool pool(2,5,true);
    /*Create a Task*/
    mytask task1(1);
    mytask task2(2);
    mytask task3(3);
    mytask task4(4);
    mytask task5(5);
    /*Execute The Task*/
    pool.execute(task1);
    pool.execute(task2);
    pool.execute(task3);
    pool.execute(task4);
    pool.execute(task5);
    /*Wait for completion of all Tasks*/
    pool.joinAll();
}

void testPrioritizedExecution()
{
    /*Declare a Thread Pool with Min 2 and Max 5 Threads, with Low 1 and 4 High Priority*/
    ThreadPool pool(2,5,1,4,true);
    /*Create a Task*/
    mytask task1(1);
    mytask task2(2);
    mytask task3(3);
    mytask task4(4);
    mytask task5(5);
    /*Execute The Tasks on priority*/
    pool.execute(task1,2);
    pool.execute(task2,4);
    pool.execute(task3,4);
    pool.execute(task4,1);
    pool.execute(task5,4);
    /*Wait for completion of all Tasks*/
    pool.joinAll();
}

void testScheduledExecution()
{
    /*Declare a Thread Pool with Min 2 and Max 5 Threads*/
    ThreadPool pool(2,5,true);
    /*Create a Task*/
    mytask task1(1);
    mytask task2(2);
    mytask task3(3);
    mytask task4(4);
    mytask task5(5);
    /*Schedule a task to be executed after the defined delay period*/
    pool.schedule(task1,10,TimeUnit::MILLISECONDS);
}
```

```

pool.schedule(task2,10,TimeUnit::SECONDS);
pool.schedule(task3,1,TimeUnit::HOURS);
pool.schedule(task4,10,TimeUnit::DAYS);
pool.schedule(task5,110,TimeUnit::MILLISECONDS);
/*Wait for completion of all Tasks*/
pool.joinAll();
}

void testDirectScheduledExecution()
{
    /*Declare a Thread Pool with Min 2 and Max 5 Threads*/
    ThreadPool pool(2,5,true);
    mytask task1(1);
    mytask task2(2);
    mytask task3(3);
    mytask task4(4);
    mytask task5(5);

## TestCppInterpreter

Example Cpp Interpreter Usage

[ffead](#), [cpp](#), [interpreter](#), [eval](#)

Updated Aug 16, 2010 by [smeet.chhetri@gmail.com](mailto:smeet.chhetri@gmail.com)

### TestCppInterpreter.cpp

```
#include "CppInterpreter.h"

int main()
{
    /*Create Interpreter Instance*/
    CppInterpreter cpi;

    /*Declare Local variables*/
    int a = 0, b = 10;
    string b = "hello!!";

    /*Bind the desired variables to the Interpreter*/
    cpi.bind<int>("a", a);
    cpi.bind<int>("b", b);

    /*Evaluate the Code String*/
    cpi.eval("while(a<15){a+=3;if(b<50){b+=10;}}");
    cpi.eval("while(a<15){a+=3;}");
    cpi.eval("int y=2;string h=\"fsdfsdfsdfsdf\";for(a=20;a>0;a--){b+=10;y++;}");
    cpi.eval("if(a==2){a=8;}else if(b==11){a=90;}else while(a<50){a++;}");
    cpi.eval("a=10-2+8-6;");

    /*Display the Modified variables*/
    cout << a << flush;
    cout << "\n" << flush;
    cout << b << flush;
    cout << "\n" << flush;
    return 1;
}
```

## TestSerialization

Example Serialization Usage  
cpp, serialization, support, ffead

Updated Aug 16, 2010 by [smeet.chhetri@gmail.com](mailto:smeet.chhetri@gmail.com)

```
#include "Serialize.h"
#include "Test.h"

int main()
{
    /*Create an instance of the Serializer*/
    Serialize ref;

    /*Decalre Objects intended for Serialization*/
    typedef map<int,Test> trmap;
    Test ooo;
    trmap oo;
    oo[0] = ooo;

    /*Serialize the Object*/
    cout << ref.serialize<int,Test>(oo) << flush;
    typedef vector<Test> terg;
    Test rt;
    typedef map<string,int> tergm;
    tergm pol;
    terg terf;
    terf.push_back(rt);
    cout << ref.serialize<terg>(terf) << flush;
    cout << ref.serialize<tergm>(pol) << flush;
    typedef vector<string> ttt;
    ttt te;

    Test tr;
    tr.setName("asdasd");
    Object tu;
    tu << tr;
    cout << ref.serialize<int>(1) << flush;
    cout << ref.serialize<float>(1.0) << flush;
    cout << ref.serialize<string>("sa") << flush;
    cout << ref.serialize<Test>(tr) << flush;

    /*Un Serialize the xml to get the Object*/
    int i = ref.unserialize<int>("<int>1</int>");
    cout << i << "\n" << flush;
    float j = ref.unserialize<float>("<float>1</float>");
    cout << j << "\n" << flush;
    string k = ref.unserialize<string>("<string>sa</string>");
    cout << k << "\n" << flush;
    k = *(string*)ref.unSerializeUnknown("<string>sa</string>", "string");
    cout << k << "\n" << flush;
    Test t = ref.unserialize<Test>("<Test><id type=\"int\">134591544</id><name type=\"string\">fsdfsdf</name></Test>");
    cout << t.getId() << " " << t.getName() << "\n" << flush;
    tu << te;
    cout << ref.serializeObject(tu) << flush;
}
```
