

School of Engineering and Computer Science

SWEN 432 Advanced Database Design and Implementation

Assignment 1

Due date: Wednesday 05 April at 23:59

The objective of this assignment is to test your understanding of Cassandra Cloud Database Management System and your ability to apply this knowledge. The Assignment is worth 5.0% of your final grade. The Assignment is marked out of 100.

You will need to use Cassandra to answer a number of assignment questions. Cassandra has been already installed on our school system. There is an Instruction for using Cassandra on our lab workstations given at the end of the Assignment.

1. Overview

Assume Wellington Tranz Metro has acquired an iPhone application that works as a data recorder for railway vehicles (cars, engines). The application uses mobile data connections to send information to servers in real time. The information includes measurements such as the location and speed of the vehicle. They have selected Cassandra as the CDBMS to use for this project. Your job is to design a database, and advise on its use. You are also required to implement a test database with a substantial part of sample data provided in the assignment, as a proof of concept. Note, the grouping of test data in sample data tables does not necessarily imply their belonging to the same or different Cassandra CQL tables.

2. Application Requirements

The application needs a database containing data about drivers, railway vehicles, time table, availability of drivers and vehicles, and current position and speed of vehicles.

Drivers

A database administrator creates an account for each railway vehicle driver through the iPhone application. Each account has the following information:

1. `driver_name,`

Model Answers

2. `password`,
3. `mobile`,
4. `current_position` (e.g. `'Wellington'`, or `'FA4567'`, or `'not_available'`),
5. `skill` (a set of train types the driver is qualified to drive).

All driver names have to be unique.

Drivers can change their password through the iPhone application. A driver must provide their current password and the new one. The application must only update the password if the correct current password is provided. Assume the iPhone sends a hashed password, so you do not worry about encryption on the server side.

When a driver comes to work at a station, she/he updates her/his `current_position` by the name of a station (e.g. `'Wellington'`). When the application assigns a driver to a service it updates her/his `current_position` to a `vehicle_id` value (e.g. `'FA4567'`) of a vehicle that is also assigned to the service. When a driver deregisters from work, she/he sets her/his `current_position` to `'not_available'`.

The application also needs the number of days per month a driver registered at work for payroll calculation at the end of a month. The payroll calculation algorithm is not of our concern, but we need to provide the appropriate data.

When a driver qualifies to drive a new vehicle, her/his `skill` gets updated.

Railway Vehicle

A database administrator registers railway vehicles. Each railway vehicle registration has the following information:

1. `vehicle_id`
2. `status` (e.g. `'Upper Hutt'`, or `'in_use'`, or `'maintenance'`, or `'out_of_order'`),
3. `type` (e.g. `'Gulliver'`, or `'Ganz Mavag'`, or `'Matangi'`, or `'Kiwi Rail'`)

The attribute `vehicle_id` has to be unique.

If the `status` property of a train vehicle has a station name as the value, it means the vehicle is operational and available and its current location is the station with the given name.

Time Table

Wellington Metro Time Table contains information about lines, services, and stations. Wellington Metro contains several lines. Each line contains several services.

Each line has a `line_name` that has to be unique.

Each service of a line has:

1. `service_no` (the ordinal number of a service within a line), and
2. a sequence of (`station_name`, `time`, `distance`) triples.

In the sequence of (`station_name`, `time`, `distance`) triples, the first `station_name` is the name of the departure station, and the last is the name of the destination station. For all stations in the sequence, except for the destination station, the attribute `time` is the departure time. The attribute `time` for the destination station is the arrival time. The attribute `time` is of the type `int` (e.g. 1005 for 10:05, or 1947 for 19:47). The sequence is ordered according to the rising values of the attribute `time`.

Different services between the same two departing and destination station may have different numbers of stations. A station may be used by different lines, and their services.

Beside the name, a station also has:

1. `latitude` (of the type `double`), and
2. `longitude` (of the type `double`).

The time table data have a number of uses. One is to publish a time table for passengers. (Note, passengers are not interested for data like `service_no`, `distance`, `latitude`, `longitude`.) The other uses are discussed in the next sections.

Allocation of Vehicles and Drivers to Services

The application extracts a list of departure stations with all services departing from a station, and orders that data according to descending values of the service departure time.

For each departure station, the application extracts from the list of departure stations a service due to be dispatched next, finds an available vehicle at the departure station (there are no services departing at the same time from the same departure station), stores the identification data of the service in the vehicle's iPhone (to allow pairing data points and services), and updates the `status` of the vehicle. The application also finds an available driver having the needed skill at the departure station, sends her/him an allocation message on her/his mobile, and updates her/his `current_position`. When the driver enters the vehicle, she/he will be allowed to start the engine only after a successful authentication. She/he performs authentication by connecting to her/his database record via iPhone.

When the service reaches the destination station, the driver turns off the engine, and the application updates the driver's and vehicle's records to reflect their availability at the destination station. Also, the application records the information that the vehicle travelled an additional distance. The application keeps record

about a daily and total distance travelled for each vehicle, and uses the data for planning the maintenance.

Data Points

The application automatically records information about the time, speed, and the position of an operational vehicle from the iPhone in the vehicle.

Each sampling of the position and other information is considered a Data Point. When the vehicle's engine has been started, the application starts sending data points every 10 seconds.

Each Data Point contains the identification data of the service and the following information:

1. `day` (of the type `int`, e.g. 20170326),
2. `sequence` (of the type `timestamp`),
3. `latitude` (of the type `double`),
4. `longitude` (of the type `double`),
5. `speed` (of the type `double`),

The application uses data points to calculate:

- Estimated departure time of a service to be displayed on station screens for passengers' convenience, and
- Time delays at the destination station to be used to improve planning, time tabling, track maintenance, and other.

The details of the calculations above are out of the scope of the assignment, but to make these calculations possible, the database should allow retrieving:

- The last data point for a service on a day,
- Data points for a service on a day in a time interval, and
- For a given data point: `time`, `distance`, `latitude`, and `station_name` of the closest (regarding latitude) stations in the north and south direction. Call these stations `north_neighbour` and `south_neighbour`.

Note: The neighbouring stations strongly depend on data points. Data points are generated by an iPhone for a service during its travel. Data points are not known in advance, accordingly neighbouring stations can't be stored in the database in advance. Neighbouring stations have to be computed upon receiving a data point for a service. So, you need to define an appropriate query that will take some data from a data point and use a table containing station data for the same service.

3. Consistency Requirements

The product team has agreed to the following consistency requirements:

1. Reading driver and vehicle data must be strongly consistent.
2. Reading Data Point and other data may be eventually consistent.

4. Infrastructure Requirements

The deployment of the application and the test database should involve:

1. One cluster with a total of 6 physical nodes.
2. Using the Cassandra 3.10 release.

5. Availability Requirements

The infrastructure team has agreed to the following Availability requirements:

- The keyspace must provide Strong Consistency for 100% of the data when one node is down.
- Assume each physical node has just one virtual node.

Note: The whole text above is completely fictional. It is made for the purpose of a students' exercise, only.

Assignment Questions

Question 1. [10 marks] List the database write and update requests the application requires using plain English.

ANSWER

1. Write a new driver details for registration, ensuring that the driver name does not exist.
2. Change the password of a driver, ensuring that the current password matches what is in the database.
3. Update the current position of a driver.
4. Update the set of skills of a driver.
5. Update the number of days at work per month for a driver.
6. Write a new vehicle details.
7. Update the status of a vehicle.
8. Increment the daily distance for a vehicle.
9. Increment the total distance for a vehicle.
10. Write the train time table.
11. Write a departure station with time and service identification (line_name, service_no).
12. Write a data point for a service.

Question 2. [12 marks] List the read requests the application requires using plain English.

ANSWER

1. Read driver details by driver name for authentication.
2. Find a driver who is available at a given station and has a certain skill.
3. Read the number of days at work during a month for a driver.
4. Find vehicles that are available at a given station.
5. Read a list of days a vehicle has been active and distance travelled.
6. Read the total distance the vehicle has travelled.
7. Read data to publish the time table.
8. Find the north neighbour for a data point.
9. Find the south neighbour for a data point.
10. Read data for the next service to be dispatched from a departure station.
11. Get the most recent data point for a service for a given day.
12. Get the data points for a service for a specified time period of a given day.

Question 3. [9 marks] Consider Cassandra data model design guidelines we discussed in lectures and list names of database tables the application requires using plain English. Recall, Cassandra tables strongly depend on requested queries. If there is no queries needing a table, the table should not exist. (Don't invent queries to justify the existence of any tables.) After each table name, list those queries you identified in your answer to question 2 that use the table.

ANSWER

driver

- 1) Read driver details by driver name for authentication.
- 2) Find drivers who are available at a given station and have certain skill.

driver_days_count

- 3) Find number of days at work during a month for a driver

vehicle

- 4) Find vehicles that are operational and available at a given station.

distance_traveled

- 5) Read a list of the days a vehicle has been active and the daily distance travelled.
- 6) Read the total distance a vehicle has travelled.

time_table

- 7) Read data to publish the time table.
- 8) Find the north neighbour for a data point.

9) Find the south neighbour for a data point.

departure_stations

10) Read data for the next service to be dispatched from a departure station.

data_point

11) Get the most recent data point for a service of a line on a given day.

12) Get the data points for a service of a line and direction for a specified time period of a given day.

Question 4. [20 marks] Create data model using CQL 3 statements that support the requirements. To answer questions, use Cassandra CCM. In your answers, copy your CCM and CQL commands.

a. **[5 marks]** Create a cluster and a keyspace that will satisfy infrastructure and availability requirements above.

ANSWER

```
haya: [~] % ccm create -n 6 t_t_t
Current cluster is now: t_t_t
haya: [~] % ccm start
haya: [~] % ccm node1 cqlsh
Connected to datacenter1 at 127.0.0.1:9042.
[cqlsh 5.0.1 | Cassandra 3.1.2 | CQL spec 3.2.0 | Native
protocol v3]
Use HELP for help.
cqlsh> create keyspace ass1 with replication = {'class':
'SimpleStrategy', 'replication_factor' : 3 };
```

b. **[15 marks]** Define tables listed in your answer to question 3 above. For the table definitions include any non default property settings. Optimize your database solution just for iPhone application queries you identified in question 2 above.

Model Answers

ANSWER

- ```
cqlsh:ass1> create table driver (driver_name text,
password text, mobile int, current_position text, skill
set{text}, primary key (driver_name)) with compaction =
{'class': 'LeveledCompactionStrategy'};

cqlsh:ass1> create index usr_pos_idx on user
(currennt_position);

cqlsh:ass1> create index usr_skill_idx on user (skill);
```
- ```
cqlsh:ass1> create table drivers_day_count (driver_name
text, month int, no_of_days counter, primary key
(driver_name)) with compaction = {'class':
'LeveledCompactionStrategy'};
```
- ```
cqlsh:ass1> create table vehicle (vehicle_id text, status
text, type text, primary key (vehicle_id)) with
compaction = {'class': 'LeveledCompactionStrategy'};

cqlsh:ass1> create index veh_stat_idx on vehicle
(status);
```
- ```
cqlsh:ass1> create table distance_traveled (vehicle_id
text, day int, daily_distance counter, total_distace
counter static, primary key (vehicle_id, day)) with
compaction = {'class': 'LeveledCompactionStrategy'};
```
- ```
cqlsh:ass1> create table time_table (line_name text,
service_no int, time int, stop text, latitude double,
longitude double, distance double, depart bulean, primary
key ((line_name, service_no), time));
```
- ```
cqlsh:ass1> create table depart_station (station text,
time int, line_name text, service_no int, primary key
(station, time));
```
- ```
cqlsh:ass1> create table data_point (line_name text,
service_no int, day int, sequence timestamp, latitude
double, longitude double, speed double, primary
key((line_name, service_no, day), sequence)) with
clustering order by (sequence desc);
```

**Question 5. [20 marks]** Provide CQL3 statements to support each of the application write and update requests you specified in Question 1 above. Show the consistency level before each write and update statement.

## ANSWER

```
1. cqlsh:ass1> consistency quorum;
 cqlsh:ass1> insert into driver (driver_name, password,
mobile, current_position, skill) values ('pavle', 'pm33',
0213344, 'Upper Hutt', {'Guliver', 'Ganz Mavag'});

2. cqlsh:ass1> consistency quorum;
 cqlsh:ass1> update driver set password = 'abad' where
driver_name = 'pavle';

3. cqlsh:ass1> consistency quorum;
 cqlsh:ass1> update driver set current_position =
'Wellington' where driver_name = "pavle";

4. cqlsh:ass1> consistency quorum;
 cqlsh:ass1> update driver set skill = skill + {'Matangi'}
where driver_name = 'pavle';

5. cqlsh:ass1> consistency quorum;
 update driver_days_count set no_of_days = no_of_days + 1
where driver_name = 'pavle' and month = 201703;

6. cqlsh:ass1> consistency quorum;
 cqlsh:ass1> insert into vehicle (vehicle_id, status,
type) values ('FA3456', 'Wellington', 'Matangi');

7. cqlsh:ass1> consistency quorum;
 cqlsh:ass1> update vehicle set status = 'in_use' where
vehicle_id = 'FA3456';

8. cqlsh:ass1> consistency one;
 cqlsh:ass1> insert into time_table (line_name,
service_no, time, stop, latitude, longitude, distance)
values ('Hutt Valley Line', 2, 0700, 'Upper Hutt',
-41.1244, 175.0708, 34.3);

9. cqlsh:ass1> consistency one;
 cqlsh:ass2> insert into depart_station (station, time,
line_name, service_no) values ('Wellington', 605, 'Hutt
Valley Line', 1);

10. cqlsh:ass1> consistency one;
 cqlsh:ass1> insert into data_point (line, service_no,
day, sequence, latitude, longitude, speed,)
values ('Hutt Valley Line', 1, 20170326, '2017-03-26
10:05:10+1300', -41.8, 176.00, 35);
```

**Model Answers**

```
11. cqlsh:ass1> consistency one;
 cqlsh:ass1> update distance_traveled set
 daily_distance = daily_distance + 34300, total_distance =
total_distance + 34300 where vehicle_id = 'FA3456' and day
= 20170326;
```

**Question 6. [29 marks]** Provide CQL3 statements to support each of the application read requests you specified in Question 2 above. Show the consistency level before each read statement. In your answer copy your CQL statement and the result produced by Cassandra from the screen.

### ANSWER

```
1. cqlsh:ass1> consistency quorum;
 cqlsh:ass1> select driver_name, password from driver
where driver_name = 'pavle';
driver_name | password
-----+-----
 pavle | pm33
(1 rows) (2 marks)
```

```
2. cqlsh:ass1> consistency quorum;
 cqlsh:ass1> select driver_name, mobile from driver where
current_position = 'Upper Hutt' and skill contains
'Matangi' allow filtering;
driver_name | mobile
-----+-----
 milan | 211111
(1 rows) (2 marks)
```

```
3. cqlsh:ass1> consistency quorum;
 cqlsh:ass1> select * from driver_days_count where
driver_name = 'pavle';
driver_name | month | no_of_days
-----+-----+-----
 pavle | 201701 | 21
 pavle | 201703 | 20
(2 rows) (2 marks)
```

```

4. cqlsh:ass1> consistency quorum;
cqlsh:ass1> select * from vehicle where status = 'Upper
Hutt';

vehicle_id | status | type
-----+-----+-----
 FP8899 | Upper Hutt | Matangi
 FA1122 | Upper Hutt | Ganz Mavag
(2 rows)
(2 marks)

5. cqlsh:ass1> consistency quorum;
select vehicle_id, daily_distance from
distance_traveled where vehicle_id = 'FA3456' and day =
20170326
(2 marks);

6. cqlsh:ass1> consistency quorum;
select vehicle_id, total_distance from
distance_traveled where vehicle_id = 'FA3456'; (2 marks)

7. cqlsh:ass1> consistency one;
cqlsh:ass2> select line_name, service_no, stop, time from
time_table where line_name = 'Melling' and service_no =
3;
(5 marks)

line_name | service_no | stop | time
-----+-----+-----+-----
Melling | 3 | Wellington | 741
Melling | 3 | Petone | 754
Melling | 3 | Western Hutt | 801
Melling | 3 | Melling | 807
(4 rows)

8. cqlsh:ass1> consistency one;
cqlsh:ass2> select * from depart_station where station =
'Wellington' and time > 555 limit 1;
station | time | line_name | service_no
-----+-----+-----+-----
Wellington | 605 | Hutt Valley Line | 1
(1 rows)
(2 marks)

```

```

9. cqlsh:ass1> consistency one;
select stop as north_neighbour, latitude, time,
distance from time_table where line_name = 'Hutt Valley
Line' and service_no = 2 and latitude >= -41.1244
order by time desc limit 1 allow filtering;
 north_neighbour | latitude | time | distance
-----+-----+-----+-----
 Upper Hutt | -41.1244 | 1000 | 0
(1 rows)
(3 marks)

```

```

10. cqlsh:ass1> consistency one;
select stop as south_neighbour, latitude, time,
distance from time_table_stops where line_name = 'Hutt
Valley Line' and service_no = 2 and latitude <=
-41.1244 order by time asc limit 1 allow filtering;
 south_neighbour | latitude | time | distance
-----+-----+-----+-----
 Upper Hutt | -41.1244 | 1000 | 0
(1 rows)
(3 marks)

```

```

11. cqlsh:ass1> consistency one;
cqlsh:ass1> select * from data_point where line_name =
'Hutt Valley Line' and service_no = 1 and
day = 20170326 limit 1;
 line_name | service_no | date | sequence
 | latitude | longitude | speed
-----+-----+-----+-----
-----+-----+-----+-----
 Hutt Valey Line | 2 | 20170326 | 2017-03-25
21:27:10+0000 | -41.2262 | 174.77 | 29.1
(1 rows)
(2 marks)

```

```

cqlsh:ass1> consistency one;
cqlsh:ass1> select * from data_point where line_name =
'Hutt Valley Line' and cervise_no = 1 and
day = 20170326 and sequence > '2017-03-26 10:49:00' and
sequence < '2017-03-26 11:19:00';
 line_name | service_no | date | sequence
 | latitude | longitude | speed
-----+-----+-----+-----
-----+-----+-----+-----
 Hutt Valey Line | 2 | 20170326 | 2017-03-25
21:07:40+0000 | -41.2012 | 175 | 70.1
(1 rows)
(2 marks)

```

**Model Answers**

## Sample Data

The following sample data can be used for testing:

### drivers:

| drv name | cur pos    | mobile | pwd    | skill                  |
|----------|------------|--------|--------|------------------------|
| milan    | Upper Hutt | 211111 | mm77   | {Matangi}              |
| pavle    | Upper Hutt | 213344 | pm33   | {Ganz Mavag, Guliver}  |
| pondy    | Wellington | 216677 | pondy  | {Matangi, Kiwi Rail}   |
| fred     | Taita      | 210031 | f5566f | {Gulliver, Ganz Mavag} |
| jane     | Waikanae   | 213141 | jjjj   | {Matangi}              |

### vehicles:

| vehicle id | status      | type       |
|------------|-------------|------------|
| FA1122     | Upper Hutt  | Matangi    |
| FP8899     | maintenance | Ganz Mavag |
| FA4864     | Wellington  | Matangi    |
| KW3300     | Wellington  | KiwiRail   |

## time table

Hutt Valley Line (north bound)

| station_name | service no |   |   |   |   |      | distance [km] |
|--------------|------------|---|---|---|---|------|---------------|
|              | 1          | 3 | 5 | 7 | 9 | 11   |               |

| Paekakariki  |            |   | 1059 |   |   |    | 33.1             |
| Paraparaumu  |            |   | 1118 |   |   |    | 51.3             |
| Waikanae     |            |   | 1139 |   |   |    | 62.8             |

**Note:** In tables above, time is represented as integer. So, you may interpret say 1025 as 10:25.

| station name | longitude | latitude |
|--------------|-----------|----------|
| Wellington   | 174.7762  | -41.2865 |
| Petone       | 174.8851  | -41.227  |
| Waterloo     | 174.9081  | -41.2092 |
| Taita        | 174.9608  | -41.1798 |
| Upper Hutt   | 175.0708  | -41.1244 |
| Paekakariki  | 174.951   | -40.9881 |
| Paraparaumu  | 175.0084  | -40.9142 |
| Waikanae     | 175.0668  | -40.8755 |

### Data Points:

| sequence                 | longitude | latitude | speed [km/h] |
|--------------------------|-----------|----------|--------------|
| 2017-03-22 10:37:50+1300 | 174.77    | -41.2262 | 29.1         |
| 2017-03-26 10:07:40+1300 | 175       | -41.2012 | 70.1         |
| 2017-03-26 10:02:10+1300 | 175.07    | -41.1255 | 40.5         |
| 2017-03-26 10:49:40+1300 | 174.8     | -41.968  | 30.8         |
| 2017-03-26 10:48:40+1300 | 176.06    | -41.3    | 38           |
| 2017-03-26 10:48:10+1300 | 175.89    | -41.523  | 67.6         |
| 2017-03-26 10:47:40+1300 | 175.44    | -40.081  | 54           |
| 2017-03-26 10:47:10+1300 | 174.8     | -40.478  | 36           |

### What to hand in:

- All answers both electronically and as a hard copy.
- A statement of any assumptions you have made.
- A file under the name `submit_file_17.cql` that contains all of your table and index declarations along with 3 `insert` statements per table and 3 `update` statements per each column you were expected to update. Note, Pavle is going to run the file using `source cqlsh` command.
- A `.cql` (e.g. `q6a.cql`) file for each valid `select` statement you issued against the database as an answer. Again, note: Pavle is going to run your `select` statements against your database using `source cqlsh` command.
- Please do not submit any `.odt`, `.zip`, or similar files. Also, do not submit your files in toll directory trees. All files in the same directory is just fine.

## Using Cassandra ccm on a Workstation

`ccm` stands for Cassandra Cluster Manager. This is a tool that creates Cassandra clusters on a local server and thus it simulates a Cassandra network.

At the command line you need to type:

```
[~] % need ccm
```

to set up the environment. You may want to insert `need ccm` into your `.cshrc` file and thus to avoid typing it repetitively whenever you log on.

The `ccm` tool supports a great number of commands. In the Assignment 1, you will need only a few of them. To see the available `ccm` commands, type

```
% ccm
```

Many `ccm` commands have options. To see available options of a command, type

```
% ccm <command> -h
```

When running a `ccm` command, do not use a `-v` or `--cassandra-version` option. The proper version of Cassandra is already installed on our school network.

To create a Cassandra cluster, use `ccm create -n <no_of_nodes> <clster_name>`.

To see available clusters and which one is the current (designated by \*), use `ccm list`.

To switch to another cluster, use `ccm switch <cluster_name>`.

To see the status of the current cluster, use `ccm status`.

To start the current cluster, use `ccm start`.

To stop the current cluster, use `ccm stop`.

To open a CQL session, use `ccm nodei cqlsh`.

To exit, from `cqlsh`, type `exit`.

**Note:** `ccm` commands will not work on any `netbsd` computers but that should not be a problem as almost all computers that students have access to nowadays are `Linux` boxes.

### Warning:

- In all deployments the same ports are assigned to server nodes. After finishing a session you have to do **ccm stop** to stop all servers of your deployment and release ports for other uses. Failing to do so, you will make trouble to other people (potentially including yourself) wanting to use the same workstation. Later, if you want to use the same deployment again, you just do `ccm start` and your deployment will resume functioning reliably.

- **You are strongly advised to use Cassandra from school lab workstations.** The school does not undertake any guarantees for using Cassandra from school servers. You may install and use Cassandra on your laptop, but the school does not undertake any responsibilities for the results you obtain.
